Don Thomas released his history of computers and video games web site.
The 8-Bit Atari is mentioned many of times and it is interesting to read
the history of the system. Check it out.

I've been to the Western Digital site recently, and they claim
to have a 6502 that can run at 8 MIPS!! Is there a difference
between those 6502 chips and the ones in our systems? If so,
would they be able to be used in our computers? Perhaps this
would be of use in your 14.36 MHZ mod? If the 6502 can reach
8 MIPs, how fast could a 65816 go?!?

I have thought of this as well. How much do they want for Atari?
And how many of us are there? Let's get the ST users in on
this conversation as well. If it could get to the point that
each person would contribute no more than $250-500, than it
could be done. Who could head Atari? I would like to say
Don Thomas, as he was the most public person who had the old
Atari spirit that I can think of. Who here knows about stocks
and investing? It appears that JTS is going into the toilet.
Is it just me, or is everything that Tramiel touches turns
to crap? What is with this family? Atari stockholders must
feel like suckers by now!

I don't know. I've lived through this "let's buy Atari" stuff before. Getting a consensus is not a problem within an ordinary corporate structure. Sometimes it doesn't even come down to that. One guy makes a decision, and that's final.

Now suppose all of us scrape up some money and make an offer, which is accepted, and we now all feel that we "own" Atari. Try and get a consensus there! Even if some real luminary like Don Thomas, or Nolan Bushnell, takes control, he'd never have a moment of peace. He'd feel as if he owed everyone of us his job, sort of like the guy who gets elected mayor of a small town by one vote.

It's also quite obvious that Atari left their designs, financial records, etc., in one glorious shambles. How do we go about rebuilding that, and can we even agree that it has to be rebuilt?

I'd love to see Atari fly again. I'd love to see a real challenge to the Intel/Microsoft dominance, even though I use that platform as well as my 8-bit. But if I'm realistic, I know that our role would probably be less that of investors and more that of willing consumers when, as I hope, an established company does the takeover.

I am for retaining as much of the original and existing
machine as possible, merely adding capability and extensibility.
14.36 MHZ/65816/512K+ ability alone would transform the system
in amazing and wonderful ways!

But what does Activision want to do with Atari? Gut it and just
sell the rights to the games? Remmber that Activision is
staffed with Ex-Atarians who left because management couldn't
tell programmers from 'towel designers'. I hope if they buy
it, that they want to restore Atari to what it should have
been.

I have another definition for 'JTS'. How about 'Jack Tramiel
Sucks'?

All I really want is new and innivative support for _BOTH_
the 8 and 16/32 bit systems. Please don't tell me the 8-bit
is "obsolete", because then you are wasting your time here.

One of the differences between an INTEL 80xx series chip and the 65xx chips is the significance of the clock speeds. The 65xx executes an instruction in as few as 2 clock cycles. The INTEL chips require many cycles to execute even a simple instruction. Of course, the INTEL clocks run at a much higher rate. But, a 33mhz 80xx chip in nowhere near 16 times as fast as a 1.79mhz 65xx. The 14.36mhz 65816 would be faster than a 33mhz 80xx for many M/L subroutines, even. Where the 80xx can make out is in the FPU that is available for it.

The biggest problem here is not the CPU (although not having to emulate
it it a plus) is emulating Antic and GTIA. These are proprietary chips
and would probably be a bit much for the Apple even with the 65816.

Source record: 67485

thank you (I get carried away sometimes)

the main point I want to make, is, that this board would have to be extensible, I think the main thing that needs to be built onto the board would be fdd and an IDE controller(at least the IDE). This would be a major door opening for Atari 8-bit users, mainly because with the extra power of the 65816, a hard drive would be a very welcome addition. The main thing that I was thinking with the OS, would be to optimize it for the 65816, in order to take full advantage of the CPU.

The problem is not so much the cycle stealing from the video but the
interrupts. Unless you disable the VBLANK, you may lose data. I had in
mind using the AP for other things also - like a serial mouse, floppy
and that kind of thing. These also suffer from interrupt latency.
The Atari can do 115,200 if you turn off everything but the idea was not
to do so.

You plug in the 65816 board into the 6502 socket. The system runs
exactly the same as it did with the 6502 until you code some new 65816
instructions into the machine.
The 7.18mhz 65816 is a whole different animal than the 1.79mhz drop-in.
The CPU can run at 7.18mhz only while it is addressing RAM memory. At
all other times, it must run at 1.79mhz since that's as fast as the
Atari chips will run. This isn't too bad if you move the OS into
RAM.....

The 800 takes a 9 volt AC transformer that outputs 3.4 amps. Most of the
remaining dealers have the at a reasonable price.

Bob

---
yes, yes, and maybe. The original post commented on the 8 MIPS 65xxx chips, not the Atari itself. I did not try to include Px type processors, but I doubt that any Pentium running at 233mhz will pump 233 MIPS..... I say I doubt because I did not look it up. It's not the point anyway. The high speed 65816s can run a lot of MIPS compared to a high speed INTEL 80386, for example, because the INTEL does a lot of clock cycles compared to a 65816. Someone looking at an 8 MIPS INTEL would get the impression that a 16mhz 65816 couldn't be as fast - not true.

I don't like MIPS ratings anyway - I have seen far too many instances where the SYSTEM runs slower on a higher MIPS processor because of other factors. I'll guess I could write programs in M/L that would run slower on your PENTIUM than my 65816... jump all over the address space and the cache is worthless.... guess the branch wrong and the pipe is gone.... write back into the instruction stream.... stuff like that.

You right about all the stuff they added to make the INTEL go fast. But, you don't need that on the 65816 in an Atari. No need for cache when you can use cache memory itself for main storage. Not much incentive to pre-decode when the instuctions are so short, either.

Bob

24. Help Need Working Mac65

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-02 00:00:00 UTC
From: dan <dalabast@sprynet.com>
Message-ID: <34AD1145.2A79@sprynet.com>
Source record: 67496

Hi everybody,

I'm looking for a Working Version of Mac65.Com assembler/editor. None of the atari site have a working version. I've tried ksk,closertohome,umich,resburg,etc. I've gone through at least 10 ATR disk images, with no luck. I've even tried individual files named mac65.com all have met the same fate. I've tried these images and files on 3 emulators Xl-it,atari800xl, and Xformer. I've tried the images and files, through APE115D on 3 different ataris, a 800,800xl,and a 130XE, all with no success :(. I've even copied these images to 3 types of disk drives, a 810,1050 and a XFF51, again no luck. Please If anybody has a working copy, that they would be willing to make a copy of, or would like to sell please drop me a e-mail. My original disk died :(. This is a horrible loss to the atari community, i hope someone can help.

The result of running Mac65 is this: usually the disk it is on loads and boots. all the dos XL commands work. running MAC65, from menu or command prompt results in garbage; alot of large colorful letters of all characters and system crash, pressing the keyboard moves the screen garbage around and then locks up, after the keyboard buffer fills :(. the file shows up as a 15,000kb file under dos or a 124 block file under dos XL. this is the one that seems to be corrupted. And again all the atari sites have the same file with (different names) the same boot readme, refering to Fine toon engineering.

Help! :)

thanks in advance to everybody, and have a great new years,
danny
dalabast@spryent.com
P.S. my ISP's newserver has been screwing up so please except my appologies for multiple listings, sorry :(.

While a second 6502 (and some memory for it, I assume) would certainly
take a burden off the main CPU, is it really necessary?

The lowly Commodore 64, with a SwiftLink (a cart containing a 6551
ACIA and RS-232 level convertors that plugs into the expansion port
and maps into memory), does 38.4Kbps. The newer version, the Turbo232
cart, does 57.6K on a standard 64. The 64 of course, also suffers
cycle stealing from the video processor, just as the Atari 8-bits do.
On a Commodore 128 (2Mhz CPU), 115.2Kbps is supported (that may be
when using the 80 column VDP, which would free up some extra time, but
I believe that rate is supported with standard VIC-II video).

Another approach might be to use a UART with a built-in buffer, such
as the 16C550 or 16C650 (or for that matter, one of the fairly
inexpensive all-in-one super I/O chips that include twin 16C550's,
ECP/EPP parallel port, etc.). From what I understand from the folks
who did the Fast-232 cart for the Tandy CoCo, however, their are some
issues to contend with in interfacing a chip designed for an 8Mhz or
faster x86 bus to a 1-2Mhz 6809 bus (which shares a lot of
similarities with the 6502 bus).

When it comes to expansion slots, why not use an existing 6502
standard...the Apple II.

In that way, existing cards could be used, with only the need for
software to address them. Apple II series cards include serial, SCSI,
and even SVGA (SecondSight card).

BTW...going off on a tangent here for a moment, I wonder why no one
(apparently) has attempted even a basic Atari 8-bit emulator for the
Apple IIgs. With a 65816 CPU and a large memory space (and some
serious speed on accelerator-equipped machines), it should offer some
unique advantages over Intel-based emulators, not the least of which
would be not having to emulate the CPU.

Getting back to the subject at hand...

Another alternative would be to go with PC slots, which offers the
plus of an even greater variety of hardware, but offers a bigger
obstacle in that it is not designed for a 65xx bus. Using a low-end
x86 CPU and some dual-ported RAM as a "card slot controller" might be
the best tactic if that route were taken. Of course, if you are going
to that trouble, just design the new Atari-compatible as a card that
plugs into a PC, and uses its resources. If anyone has access to one
of the old Trackstar Apple II hardware emulator cards for the PC,
examining it should give some good pointers on how to couple a 6502

CPU and memory to the ISA PC bus.

>If yes, where can I receive this hardware?

There are at least 3 external boxes that accept composite (and except for one, S-video) inputs, and display on any VGA/SVGA monitor. They are:

(1) Instant TV (from AIMS labs, as I recall)
(2) AVer TV Genie (from AVer Media)
(3) ProView (can't recall who makes this one)

I have not seen the Proview in a while, and it was the only one of the three that did not handle S-video (chroma/luma).

The Instant TV is probably the most widely available. If you have a Best Buy store in your area, check the computer section, as the local one here sells it. You might even find one at your local Wal-Mart.

AVer TV Genie is available via mailorder through almost as many places as the Instant TV, although I cannot recall if I have ever seen it in a retail store.

I also saw a fourth unit, whose name I cannot recall, in the video editing/display section at a Computer City store.

>Any e-mail-addresses or webpages?

Not off hand, but doing a search page hunt on the device and company names should turn up something.

If I get a chance, I'll check around, but my PC is acting up (some type of hardware problem...possibly CPU overheating), so I can only stay online so long before the system crashes and locks up. :(

I can't say I have ever had that problem with my 8-bit systems, but then none of them offers a graphical web brower (or any software that uses TCP/IP, for that matter, and certainly not for free).

I am unsure how Apple II cards work but:
1) I doubt they memory map into any space that is compatible with the 800.
2) Even if they do, chances are their driver ROMS are incompatible with
the Atari.
3) There is already an existing standard for the XL/XE. There's no reason
not to use the PBI, except maybe for the fact that there are not the extended
A16-A23 address lines on it.

I've actually seen an Apple II on a board (go see http://apple.rum.org/
and go to pictures -> hardware)...

I'd kinda like to see either a PCI bridge for the 6502 or a Atari on a card.
It's still more hardware work than my pea-sized brain is capable of though.

> Come on, folks. Let's all chip in and make JTS an offer to buy Atari!
And do what with it? Atari is nothing but a bunch of patents. I
don't suppose there is much revenue from those as they already made
agreements with most of the heavy users like Nintendo et al. There's
virtually no information on most of the product range - certainly the 8bit
stuff is all long gone. There is pretty much zero inventory, remember all
the little 'sales' here on Usenet before they had just before calling it a
day?

The staff have all gone, the skills have all gone. All you'd have is a
name, a right to use that name in certain markets (Atari, the coin-op have
some areas sewn up already). You'd be mad to want to do anything with even
their latest hardware. the Jag as that's now embarassingly long in the
tooth.

Best you could hope for is to do some R&D and sell Atari branded add-ons &
new models of their existing product to the few people that care i.e. the
Usenet mob in atari.8bit & atari.st. Not a lot of money to be made there.
Unless you can get a major shit-load of venture capital and design
something to kill the Nintendo/Playstation stranglehold (yeah, right) then
forget it. Computers? It's PC or bust now. Apple are shriveling, The Be
has done much, and hardware prices have fallen so much there just isn't a
need for another computer or computing standard. We all know the PC is a
load of ancient ideas wrapped in a glossy shell or high-tech and that
Win95 is a piss-poor excuse for an OS but most people (i.e. where you ,ake
your money), simply don't care.

Let's be honest here, we all loved Atari, heaven knows I've bought enough
of their stuff over the years, but it's all just a bunch of memories from
a happier time. Atari is dead, the name is dead, the product is dead. Long
live Atari!

I would be happy with a press release from JTS releasing Atari's
8-bit (existing or not) software source code/executable images
and publications into the public domain. Or copyrighted as
freely distributable.

The executables you could have. AFAIK, the source is long gone along with
diagramatics etc when they ditched a VAX in the late 80's without backing
it up first.

That's why I wrote "existing or not".

Any clever, zealous Atari 8-bitter with a disassembler
and no social life could reconstitute assembly source
for just about any program. AFAIK, as the copyrights go
that source would still belong to Atari since it was
reverse-engineered from an Atari executable. Unless
the program is in the public domain to begin with there
wouldn't be much motivation to produce source for
various programs/OSs.

All of the plans and engineering specifications for the custom 8-bit
chips were stored on a VAX. No other known copies of the plans
existed elsewhere. The VAX was sold to another company that promptly
reformatted the VAX's drives. Not only will it be necessary to gain
access to a chip fabrication plant, extensive and error prone reverse
engineering will likewise be necessary.

From: he110@cleveland.Freenet.Edu
Message-ID: <68k45r$k7m$1@alexander.INS.CWRU.Edu>
Source record: 67499

Mr. Woolley, How much of a performance increase would your
1.79 MHZ 65816 modification give over a standard system?
How much would it lessen any bottlenecks to faster MODEM
access? And would it be able to be installed in a 130XE
system? What would the advantages be with this mod?
All this talk has led me to believe that incremental
progress is in order here. I really think that if it is easy
for you to do this, then perhaps we should start there.
Even a small performance increase would blow my mind;
I have the CSS+ OS installed, and it definitely makes a
difference.
One more question, can one progress to the 7.18 MHZ mod
from the 1.79 MHZ one? Count me as interested!

It sure is possible!

I have my Atari 8-bit hooked up to a ViewSonic G773 multi-synch VGA+ monitor via an AverMedia TVGenie external box using an S-Video to two RCA plugs (luma and chroma) cable.

You can make one yourself or buy one for $25 or so depending on length from Redmond Cable.

The TVGenie can be had for $120 or so. It allows for pass-through RGB from your PC or Amiga! (big brother to the the Atari 8-bit) AND scan doubles the S-Video or composite, or cable/TV signal onto a VGA monitor.

It works great!

And looks pretty good too. You will get bleed at 80-columns due to the fact that the scan-doubling is to 640x480 only. But for regular 40 columns and games it is pretty sweet.

Of course, if you want to spend 800+ you can get some really superb broadcast composite/S-Video scan doublers to VGA level.

Some PC cards allow for S-Video or composite inputs, too.

Anybody else got their 8-bit hooked up to a VGA monitor?

Tom

: There are at least 3 external boxes that accept composite (and except
: for one, S-video) inputs, and display on any VGA/SVGA monitor. They
: are:
:
: (1) Instant TV (from AIMS labs, as I recall)
: (2) AVer TV Genie (from AVer Media)
: (3) ProView (can't recall who makes this one)
:
: I have not seen the Proview in a while, and it was the only one of the
: three that did not handle S-video (chroma/luma).
:

: The Instant TV is probably the most widely available. If you have a
: Best Buy store in your area, check the computer section, as the local
: one here sells it. You might even find one at your local Wal-Mart.
:
: AVer TV Genie is available via mailorder through almost as many places
: as the Instant TV, although I cannot recall if I have ever seen it in
: a retail store.
:
: I also saw a fourth unit, whose name I cannot recall, in the video
: editing/display section at a Computer City store.
:
: >Any e-mail-addresses or webpages?
:
: Not off hand, but doing a search page hunt on the device and company
: names should turn up something.
:
: If I get a chance, I'll check around, but my PC is acting up (some
: type of hardware problem...possibly CPU overheating), so I can only
: stay online so long before the system crashes and locks up. :(
:
: I can't say I have ever had that problem with my 8-bit systems, but
: then none of them offers a graphical web brower (or any software that
: uses TCP/IP, for that matter, and certainly not for free).

Flip-Flop is a cool game. I spoke with it's author some time ago on
the phone (he called for tech support at a company I once worked for).
Real nice guy. I almost felt bad when I told him I was the one that
cracked the disk.

If you can't find that image somewhere else, let me know and I'll dig
it up.

Hi,

I use such a program. It converts hypertext to ascii, but
textpro can do the ascii to atascii afterwards. The program is called
HTMSTRIP, by

Bruce Guthrie
Wayne Software
113 Sheffield St.
Silver Spring, MD 20910

fax: (301) 588-8986
e-mail: bguthrie@nmaa.org
http://hjs.geol.uib.no/guthrie/

I just tried the http and it has been changed to

http://www.geocities.com/SiliconValley/Lakes/2414

Sure enough, there was HTMSTRIP along with a bunch of other
utilities Bruce had written, ready for download. Hope this helps.

Look I was just at the CMD site and saw a working 20Mhz C-64 expansion... see it for your selves at:

http://www.cmdweb.com/supercpu/

This unit uses a 65xxx CPU.... while your there take some time to check out all the other neat stuff they got.... Like 2 Gig HD and 16MB expanion cards. The C-64 also has a Graphic interface much like Windows called GEOS (graphic environment OS) and a super fast OS called JiffyDOS which transfers at rates of 100MB/Sec. They also have a RS-232 which maxes out at 115K baud.

Why can't the Atari 8-bit do this? The GTIA chip is awesome from a 8-bit stand point but I think the Commie won out on sound... with it's SID chip it may have only been 3 channels but it had a wavetable which could create very realistic sounds, comparable to the 8-bit Sound Blaster.

I love the Atari, that's what I started with and it was hard to give it up! I had a ST and a C-64 but my Atari was always the best. I know this is stupid but it kinda hurts to see those commie guys with all that cool shit! The Atari has a soul... no other computer I've ever used has had that... that's what I miss.

Sorry about the reminisant BS.
Mike

> Come on, folks. Let's all chip in and make JTS an offer to buy Atari!

What would be really cool would be if Phase 5 (http://www.phase5.de/)
bought Atari. Then, their A\Box computer would become an Atari product.

For those of you who don't know what the A\Box is, it is a new computing
platform (due to be released sometime this year) who'se design makes it
worthy of being a successor to the Atari 8-bits and the Amiga (thanks to the
Display-list RISC processor). It is based on PowerPC CPUs, and has a
microprogrammable multimedia chip, and it seems to be the last hope of
kicking the PC off the face of the earth (The description I've given here
doesn't do this beast any justice).

To find out more about this computing platform, look at Phase 5's A\Box page
at:
http://www.phase5.de/news/projectinfo/aboxinfoe.html (english)
http://www.phase5.de/news/projectinfo/aboxinfod.html (german)

Or you can look at unofficial A\Box pages at:
http://www.amitar.com.au/~bluey/abox/
http://www.algonet.se/~per-l/abox/

The fluffy AE.

you assume that the competition for desktops will be waged by like-kind products. like-function products can and probably will sink both Microsoft and Intel. a bigger, better wintel system is not going to beat them, that's true.... consider the support costs of such products and, as our old friend used to say, "do the math"!

Wavetables? I don't believe so. You could play back sampled sound
on the C64 pretty much the same way as on the Atari 8-bits. (Read:
lots of CPU activity.) But I never ran across anything remotely
related to wavetable samples when I was programming the C64.
And I found the C64 sound thin and whiny.

>I love the Atari, that's what I started with and it was hard to give it up! I

Jack T put a C64 in about every other house because computers
were too technical for people to really understand, so most
made decisions based only on price. The large base of users
made it a more inviting platform for developers. Also, the
potentially large base of repeat buyers made it possible for
Commodore to add upgradesto the computer such as real 80 column
text hardware while at the same time that Atari was abandoning
the 8-bits.

I've got the floppy that came with the P:R: connection. (I can't
look at it at the moment, but...)
It has a PRC.SYS file that is used to improve compatability
with some badly behaved programs that assumed some things
about the 850.

Page 2 of my P:R: manual also says:

This ROM [inside the P:R: Connection] also contains the
software handler which loads into the Atari computer (when
called) and sets up the two serial ports as 'R:' devices
('R1:' and 'R2:') This 'R:' handler is loaded either with
the AUTORUN.SYS (RS232.SYS) which comes with Atari DOS
(RS232.COM with SpartaDOS) or else whenever the computer
is powered up with the P:R: Connection attached and no
disk drives respond.

So, it sounds like there is also a rs232.com or something
to make the P:R: serial handler load when the computer
boots from disk?

Otherwise, it sounds like it works without the disk.

I have the following hardware that I'd like to trade for. First, let me
list the items that I'm searching for:

Syquest 44meg removable SCSI hard disk
Modified Atari 800 (preferably some type of mem upgrade)
256-512byte format SCSI hard drive, usable by black box (300+mb)
X10 devices for Atari (with software)

I have the following items that I'd be willing to trade:

Adaptec 4000a MFM-SCSI controllers
ATR8000
Hayes Ultra 9600 modems
850 Interface
PR:C Interface
XF551 disk drives
Trak ATD4 disk drive
US DOubled 1050 disk drive
Audio modified Atari 400
Multiple styles of printer interfaces(APE, AXIOM, etc.)
IO Cables

Looking to put a computer into my garage, could be an Atari, could be a 486 PC. Before I decide which, I'd like to know if there exists for the Atari, any type of automotive tracking software? Specifically, something that will watch and track oil changes, tune up specs, etc..?

I'd like to be able to enter spark gap info, last oil change date, major services perfomed (by date), etc..

Source record: 67444

For those of you running emulators or APE on your Atari computers, I have a potentially helpful program that runs on the PC. It will view or extract files from and ATR or DSK image file and supports AtariDOS, SmartDOS, and SpartaDOS. You can download it at: http://www.pacificnet.net/~panther/Atari/

Also, I am looking for an ICD MIO interface (preferable 1MB version). I'm willing to pay cash and/or trade.

The new version of the Giant List of Classic Game Programmers has been
posted to:

http://www.dadgum.com/giantlist.html

In addition to the list addtions, there are some great little news items:

* The story behind Midway's Omega Race
* An unreleased Cinematronics game
* The other sequel to Star Raiders
...plus some other trivia.

Enjoy!

Are you in fact saying that certain operations on the 65816
could be as fast or faster than equivalent operations on a
'386 or even '486? That in certain instances our 65816-equipped
Ataris could out-speed a '386 or '486 class processor?
Very interesting, and food for thought!

Now wasn't Western Digital working on a 65832??

Source record: 67519

I was cleaning out my attic over the holidays, and found my old Atari 800. I hadn't seen it in over 8 years. It wouldn't power up, but I'll soon fix that. I got on line and found ya'll. I was a little surprised to find that anyone still remembered, let alone used, the old 8-bit machines. I suppose I shouldn't have been though, we always did have a reputation for being fanatical about our machines. It appears that the Atari community has been continuing to use the inventive drive it's had from the beginning. One question, do any of the old user groups like M.A.C.E. still exist?
Is there one anywhere near upstate South Carolina or western North Carolina?
Thanks much!

Jerry Fulkerson

There's a guy in Poland that makes them and auctions them on eBay... They usually go for about $10, plus $5 shipping to the US.

I would grately appreciate any assistance with problems I am encountering while using my SIO2PC 2 chip cable. I have Nick Kennedy's software ver 3.19 but can't seem to get the program to recognise my 130XE. I have it set up for COM 2, autolocked & high speed transfer, (I have tried the opposite), but it only sparodically accesses the Atari.ATR image if at all when I power up my 8-bit. I have read the help text files & am none the wiser. Could I have a faulty cable?

Two thoughts come to mind. One involves the type of cable you're using. One-chip and two-chip cables require different "versions" of the software, but the docs clearly state how one can be converted to the other using DOS's DEBUG. However, having a cable-software mismatch usually results in NO performance.

You might have a timing problem. Again, the manual is the best way to attack this problem. You say that you can access an ATR but only sporadically, so my money is on timing. First disable the high speed mode. You're best setting timing without it and then switching to it, if necessary.

It has been some time since I last had contact with Nick Kennedy, but I've found him to be very responsive. The same is true for Stephen Tucker regarding the A. P. E. software, which should also work with your SIO2PC cable. Maybe trying that software will also help.

I can't tell you about groups in the Carolinas, but I belong to a group that has international membership -- The Ol' Hackers AUG on Long Island. I know that there are several others like the AAAUA in San Antonio, TX, the GCACE in Canada, PACE in Largo, FL, etc. All have public domain/shareware libraries; all publish newsletters.

(I know I left some out, you guys are free to jump in here and remind me:-))

My user group does a bimonthly newsletter that comes out on disk with a facility for printing the text articles. It also usually contains several programs, ready to run.

And yes, the community is still alive and kicking, and still inventing new ways to use the machines and improve them. Some of us have found ways to use PCs to enhance our 8-bits, some have found ways to emulate the 8-bit on other platforms, some are looking into using the 65816 chip to continue where the 6502 has left off, and some are exploring means of high-speed communications.

Stick around a while and rediscover what Atari 8-bits have to offer!

81. TCP/IP for Atari 8bit?

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-04 00:00:00 UTC
From: "Jay N. Yepuri" <jnyepuz1@ulkyvm.louisville.edu>
Message-ID: <34AFB84B.347D@ulkyvm.louisville.edu>
Source record: 67526

Hello,

So I followed the thread about the 20Mhz 65816 available for the C-64, and I even (gasp!) linked to the website advertising this device.

Suffice it to say, I was impressed as to what the Commies have been up to. However, given the discussion on this NG, it looks like such abilities for the A-8bit are there/not that far off.

I was, however, intrigued by two things:
1. They have TCP/IP. Does the Atari 8bit? Does anyone know if/when we will get this ability, or if it's even possible?

2. The graphical interface (GEOS). Someone mentioned a German written GUI for the A8bit a little while back, and I was wondering where I could get more info on the thing, where to get it, etc. Correct me if I'm wrong, but does DGS also have a GUI for sale?

Thanks,
Jay Yepuri

For those people who want to see WinTel hurt, your best bet is going to come
from the goverment. However, for those power hungry state-of-the-art types
you should check out Apple's Rhapsody. Simply put it is a three box OS.
Yellow box, blue box and Red box. Blue box is the Mac OS. Yellow box is a
new Mac GUI with NeXt features. Yellow box will be free and runs on x86 chips
and under NT. Blue and Yellow run on top of Red which is the MACH Unix
kernel.

I've seen this thing run on a PowerPC Mac. (And not the new G3 chips which
kick Intel's butt.) It is fast! Application design is a snap via OpenStep
technology (modified of course). When Apple releases it in 98 (and
hopefully before Win98 gets out) I'm scrapping my PC and Unix boxes for it.
I'm a diehard 8bitter and Unix guy. I've seen the light.

As for buying Atari: If we did such a thing, probably the best thing to do would be to start producing small products for other systems. Hardware based and then perhaps software based. During that time, you take anyone to court that you can for violating your patents.

It is a nice dream to see Atari fly again. However, it isn't in "Atari's" best interest to produce products for the ST/XL line. As a side project, perhaps "Atari" could dig up whatever is left and distribute it via the last remaining Atari stores. To ask for them to make things *free* puts them at risk as well as BEST, and B&C and the other remaining Atari dealers.

I'd be happy to see "The New Atari 64Bit Graphics Card" for your PC's. Or the new "Atari sound and midi card", or the new Atari graphics display chip for new digital dashboard cars, etc... I see it more as a PowerPC type of flying (PowerPC's are in a lot more things than just Macs) than a "Atari launches new computer, Microsoft and Intel are at a loss as to how to compete!".

On the video game front, there is that rumored Project X that could be purchased.

By the time the a/box comes out wintel machines will be 2x or 3x faster
anyways. with an established and recognized standard/consumer base. the
a/box is a stillborn system :-(

still vote on this -
>I vote to delete him.

Bob Woolley

He is one of them, but by far not the worst. Gene Ehrich has got to be the
worst offender of this that I have run into. Athough most of his offerings are
in "Comp.Forsale". He occasionally sneeks in here too. What gets me with him is
the fact that his ads read: "For sale by private individual", then he goes on
to post 6 msgs covering software & hardware on just about ever platform ever
made. Now just what about that says "PRIVATE INDIVIDUAL". Looks more like
someone trying to run a business without having to report sales taxes, or
income from the sales!

Bob

you certainly are in the right place! :)

As Bob had pointed out. You don't need the P:R Connection disk for any of
the drivers. There are only 2 drivers on the disk, (Prc.Sys, Rs232.Sys).

Here is a directory listing of the P:R C disk.

Zach's Moving Auction Update # 3.0

Here are just the Atari and C64 carts that are part of my larger auction
going on right now - ends Weds night!

Commodore 64 - Cartridge

Gridrunner HesWare $2.00 None 3T
Pole Position Atari $2.00 None 3T

Atari 8 Bit - Cartridge

Q*Bert Parker $3.00 Bigham 3T
Math Encounter HSU $2.50 Jaguar 1T
Deluxe Invaders Roklan Weird label Fade $3.00 Bigham 3T

Atariwriter Atari $2.00 None 3T
Basic Atari $2.00 None 3T
Defender Atari $2.00 Bigham 3T
Eastern Front (1941) Atari $3.00 Bigham 3T
Galaxian Atari $3.00 Bigham 1T
Qix Atari $4.00 Bigham 1T
Space Invaders Atari $5.00 Bigham 3T
Star Raiders Atari $2.00 Bigham 3T

Neat Stuff and Hand Held Games

Atari 2600 Dust Cover
Very cool, and the only one I've seen. If I didn't need some
moving money best believe I would be keeping it! It's dark brown
in color and has the Atari logo and name printed large in the
middle in white. Some fading has occured in one area that makes
it a little bit lighter brown than the rest. The Atari logo is
very clean and intact. Protect your console from the harsh elements!
Bid.....$5.00 DCO 3T

Invaders From Space by Epoch - 1980
Here's the scoop! Very cool hand-held Galaxian clone from
Epoch who made a lot of the cool hand held LED and LCD games (like
"Epoch Man"!). It's white plastic and a little bigger than a video
cassette. In the middle is a black circle/dome where the game play
takes place. The invaders fly around and drop as in Galaxian or
Galaga and you move left and right at bottom to shoot them as they
rain shots at you also. Very smooth game play for a small game.
Controls are a fire button, metal 2-direction joystick, power,
level, and start button. Battery cover intact. Takes 4 AA

Batteries or power pack not included. NOTE: When I tested the game
I didn't get any sound effects... it most likely has some.
Bid.....$15.00 Locust

Pac Man by Coleco
Yes, the one and only Pac-Man table top game by Coleco. Looks like
miniature arcade game. Game play is very nice! Features 2
joysticks for 2 people to play. Has some wear and missing battery
cover. Not much else I can say on this one.... most people have one
already! Since there is no battery cover, I'll start it at $10.00.
If that's too much, I'll keep it!
Bid.....$12.00 CGMR 1T

Sears Video Arcade II
This system is a souped up Atari 2600. A similar model was sold in
Japan under the Atari name, but in the U.S. it was only sold as the
'Sears Video Arcade II'. It is styled like a 5200 but smaller and
has 8 flush buttons on top with red LEDs that light when they are
pressed. There are 4 joystick ports.. I can't recall why there are
four ports? Anyways, someone will know and tell me and I'll pass it
on. I only have the console. It runs on same equipment as the 2600
so you probably have what you need.
Bid.....$7.50 Frandsen 1T

Yes, still going and worth contacting if someone is looking for some "lost
treasure" of 8-bit software. There was also *some* hardware there about a
year ago, but he said he was finding it harder to shift.

Subject: 1.1) What is an Atari 8-bit computer?

400 800 1200XL 600XL 800XL 65XE 130XE 800XE XE Game System

Here is a very condensed history of Atari, centered around their 8-bit computers.

1972
Atari Inc. is formed by Nolan Bushnell, incorporated on Tuesday, June 27. Atari created the first coin-operated arcade video game with the introduction of Pong. The video game industry was launched and has shaped pop culture ever since.

1976
Warner Communications acquires Atari Inc.

1977
Atari launches the Video Computer System (VCS), giving birth to home video game systems.

1978
In December, Atari announces the Atari 400 and 800 personal computers, using the 6502 microprocessor. The Atari 800 was code-named "Colleen"; the 400, "Candy."

The following are most of the team who originally designed the 400/800.
Credit for providing this information for the FAQ goes to:
Doug Neubauer (by way of James Finnegan, mailto:finneganj@delphi.com)
Jerry Jessop, mailto:jjessop@ix3.ix.netcom.com
Scott Emmons, mailto:scotte@center.uscs.com

VLSI HARDWARE:
Jay Miner - Creator and System architect, VSLI manager
Steve Mayer - Also one of the creators - Partner in "Cyan Engineering"
Lawrence D. Emmons - Also one of the creators - Partner in "Cyan Engineering"
Joe Decuir - ANTIC and system and creator
???A French guy - ANTIC logic designer
George McLeod - CTIA and GTIA logic design
Doug Neubauer - POKEY logic design

Mark Shieu - POKEY chip design
Steve Stone - POKEY layout design
Steve Smith - Technician for ANTIC and GTIA
Delwin Pearson - Technician for POKEY

OS PROGRAMMERS:
Larry Kaplan
David Crane
Bob Whitehead
Al Miller

1979
The Atari 400 and Atari 800 Home Computers debut at the Winter Consumer Electronics Show (CES) in early January.

Jerry Jessop, mailto:jjessop1@home.com writes:
"The first official small shipment of the 400/800 was on August 29th 1979. These were hand built pilot run units to Sears that needed to be in stock by Sept. 1 so they could be placed in the big fall catalog. The units were placed in the Sears warehouse and then immediatly returned to Atari after the "in stock" requirment had been meet.

The first "real" consumer units were shipped in Nov. of 79 and were 400's to Sears followed very shortly by 800's."

These MOS Technology 6502-based systems run at a clock speed of 1.79 MHz, offering 128 colors displayable simultaneously, up to 320x192 graphics resolution and up to 40x24 text resolution in 8 graphics modes and 6 text modes. Video may be displayed either on a composite video monitor in the case of the 800, or on a standard television for both systems. 4 independent sound voices are available through the audio output of the television or monitor, each with a 3 1/2 octave range, plus there is a built-in speaker for key-click and other programmable sounds. The 800 has a second cartridge port and a full-stroke keyboard, while the 400 has a single cartridge port and a membrane keyboard. Each has 4 serial controller ports and an Atari Serial Input/Output port. Originally, both the 400 and 800 were sold with 8K RAM, but later most 800's were sold with 48K and 400's with 16K. Each includes the 10K Atari Operating System in ROM.

1981
November: 400/800's begin shipping with the new GTIA chip in place of CTIA, increasing the palette of simultaneously displayable colors to 256 and adding 3 new graphics modes. CTIA is totally phased out by the end of the year.

Jerry Jessop, mailto:jjessop1@home.com adds:
"The very first proto systems did have the GTIA, but it had some problems and was not released in the consumer version until 1981. The GTIA was completed before the CTIA."

1982
The introduction of the 1200XL in late 1982 marks the single largest advance in the 8-bit Atari system. The 1200XL runs most software and hardware designed for the 800 and 400, but now runs a slightly more advanced 6502C

microprocessor, and includes a full 64K RAM. The single cartridge and monitor ports remain, along with 2 controller ports. In addition, the 1200XL includes 4 programmable Function keys and a Help key, built-in diagnostic and graphics demonstration programs, and probably the favorite keyboard of any 8-bit Atari computer. Clicks previously outputted through the built-in speaker are now heard from the television or monitor's speaker. The revised 16K Operating System offers many new features, including an alternate International Character Set.

1983
In 1983 Atari replaced the 1200XL/800/400 line-up with the new 800XL and 600XL. These new machines include most of the features of the 1200XL minus the Function keys and the demo program. But now both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Bus Interface (PBI), providing direct memory access to the heart of the computer. The 800XL contains 64K RAM while the 600XL has 16K RAM.

1984
Warner Communications sells Consumer Electronics and Home Computer divisions of Atari Inc. to Tramiel Technologies on Monday, July 2.

Atari Corporation is formed by Tramiel Technologies and its products marketed under the Atari brand.

(Atari Games Corporation is also formed from the former coin-op division and markets coin-op games under the Atari Games brand.

Today Atari Games is an indirect, wholly-owned subsidiary of the Midway Games division of WMS Industries.

WMS Industries Inc.
3401 N California Ave
Chicago IL 60618-5899
USA
http://www.wms.com/

Midway Games Inc. (a division of WMS)
http://www.midway.com/

Atari Games Corporation (a subsidiary of Midway Games)
http://www.atarigames.com/)

1985
The new Atari Corp. delivered on its promise to advance the 8-bit Atari system by replacing the 800XL/600XL with the new 130XE and 65XE in 1985. The 65XE is nearly identical to the 800XL in features, minus the PBI. The 130XE, however, offers 128K RAM, plus the FREDDY chip, supporting the unique (but rarely used) ability for the 6502C and the ANTIC to independently access RAM banks. In addition, the 130XE replaces the PBI port with the Enhanced Cartridge Interface (ECI), continuing the powerful feature of direct memory access.

1987
In a change of marketing strategy, Atari introduced the new XE Game System

in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system. It offers the convenience of a detachable keyboard and built-in Missile Command game, while offering 64K RAM and full compatibility with the 65XE.

The 800XE, a 130XE with just 64K, was released at some point in eastern Europe. [WHEN???]

1992
Atari officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

1996
On July 31, 1996, Atari Corp. became a JTS Corp. subsidiary.
JTS Corporation, with headquarters in San Jose, Calif., was founded in 1994 to design, manufacture and supply enhanced-capacity hard disk drives for the notebook and desktop personal computer market. JTS offers an innovative line of ultra-slim 3.0-inch disk drives that provide higher capacity and lower cost per megabyte than competitive alternatives in the portable computer market. The president and chief executive officer of JTS, Tom Mitchell, was formerly the president and chief operating officer of Conner Peripherals and co-founder, president and chief operating officer of Seagate Technology.

Subject: 1.2) What can I do with an 8-bit Atari?

What can you do with an 8-bit Atari computer system? Virtually anything you can do with any other type of computer!

Programming? Pascal, C, BASIC, Logo, Pilot, Forth, Lisp, 6502 assembler... Plus powerful unique languages like Action! and QUICK...

Word Processing? Try AtariWriter, Letter Perfect, Paperclip, TextPro, Bank Street Writer, 1st EXLent, TurboWord, Cut & Paste, Letter Wizard, Panther, Superscript...

Database? Try TurboBase, TurboFile, Synfile, Data Perfect, MicroFiler, MegaFiler, Homebase, Super Data Base 1-2-3, Small Business System...

Speadsheet? Look at Syncalc, Visicalc, TurboBase, Calc Magic, Turbo-Calc, SAM Budget...

Communications? There's Express!, BobTerm, Kermit-65, Omnicom, VT850, Chameleon, Ice-T, FlickerTerm 80, Term80...

Graphics? Print Shop, Newsroom, Blazing Paddles, Video Title Shop, Virtuoso, Movie Maker, News Station, Publishing Pro, Awardware, Page Designer, ChromaCAD, Rambrandt...

Music? Virtuoso, Music Studio, Music Construction Set, Songwriter, Electronic Drummer, Music Painter, Music Composer, AtariMusic, MIDI-Track, Digital Music System, Chaos Music Composer...

Alternate Operating Systems? There's the Diamond Graphic Operating System; SpartaDOS X, the 64K DOS on a "supercartridge"; the S.A.M. (Screen Aided Management) 80 column Desktop System; the Ultra Speed Plus OS; the TurBoss! High Speed O/S...

Hardware? A plethora of upgrades and add-ons are available, realizing improvements in speed, memory, sound, graphics, storage media...you name it!

Education? Colorful graphics, exciting sounds and full-screen editing give rise to hundreds of quality educational software titles.

Entertainment? The 8-bit Atari has long been famous for thousands of great games.

If you want to do something with a computer, chances are you can do it on an 8-bit Atari computer. While slower than today's PC's, the 8-bit Atari is far less costly than any of these, is easier to program at the machine level or alter at the hardware level, and has been documented more thoroughly than any of the newer computing platforms. The relative simplicity in design of the 8-bit Atari also means that many people find the systems more reliable than their modern counterparts.

The software for the 8-bit Atari is sometimes more powerful than on any other platform. For example, some Bulliten Board Systems are still run on 8-bit Ataris specifically because the BBS software available can be better than that for any other type of computer. There is a reason for the relative quality of software on the 8-bit Atari. People program commercially for the latest PC's to make money; people program the 8-bit Atari because they want to -- they enjoy producing good software. It takes a team of specialized programmers to develop a major piece of software for those other systems; with the 8-bit Atari, a single person has the chance to learn the entire system, thereby developing greater pride in his programming abilities and his final product. The character of the programmer can shine through.

The 8-bit Atari owner can take pride that his/her computer platform was developed years before the IBM PC or Apple Macintosh were even on the drawing boards, but remains as useful today as it was in 1979.

For these reasons and more, the 8-bit Atari remains a popular alternative in today's home computer marketplace.

Subject: 1.3) What are the some of the performance features of the 8-bit Atari?

Some of this text by mailto:kendrick@zippy.sonoma.edu (Bill Kendrick).

CLOCK SPEED:
NTSC machines: 1.78979 MHz
PAL machines: 1.773447 MHz

SCREEN REFRESH RATE:
60 times per second (Hz) on NTSC Ataris
49.86 Hz on PAL machines

ANTIC AND THE DISPLAY LIST:

ANTIC Mode #	CIO/BASIC Graphics #	Display Type	Resolution (full screen)	Number of Colors
2	0	Char	40 x 24	1 *
3	-	Char	40 x 19	1 *
4	12 ++	Char	40 x 24	5
5	13 ++	Char	40 x 12	5
6	1	Char	20 x 24	5
7	2	Char	20 x 12	5
8	3	Map	40 x 24	4
9	4	Map	80 x 48	2
A	5	Map	80 x 48	4
B	6	Map	160 x 96	2
C	14 ++	Map	160 x 192	2
D	7	Map	160 x 96	4
E	15 ++	Map	160 x 192	4
F	8	Map	320 x 192	1 *
F	9 +	Map	80 x 192	1 **
F	10 +	Map	80 x 192	9
F	11 +	Map	80 x 192	16 ***

* 1 Hue; 2 Luminances
** 1 Hue; 16 Luminances
*** 16 Hues; 1 Luminance
+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.

GRAPHICS INDIRECTION (COLOR REGISTERS AND CHARACTER SETS):
Nine color registers are available. Each color register holds any of 16 luminances x 16 hues = 256 colors. (Four registers are for player-missile graphics.

Character sets of 128 8x8 characters, each with a normal and an inverse video incarnation, are totally redefinable.

PLAYER-MISSLE GRAPHICS:
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available. A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

DISPLAY LIST INTERRUPTS (DLI's):
Screen modes can be mixed (by lines) down the screen using the Display List - a program which is executed by the ANTIC graphics chip every screen refresh:

All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via DLI's.

SCROLLING:
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.

SOUND:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.

A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.

Subject: 1.4) What is the internal layout of the 8-bit Atari?

The following text was written by Chris Crawford and appears in De Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc., 1981-1982. It has been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM, ROM, and a (PIA). However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms of silicon area) as a 6502, so the three of them together provide a tremendous amount of power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

ANTIC ("Alpha-Numeric Television Interface Circuit") is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

CTIA ("Color Television Interface Adapter") / GTIA ("George's Television Interface Adapter") is a television interface chip. ANTIC directly controls

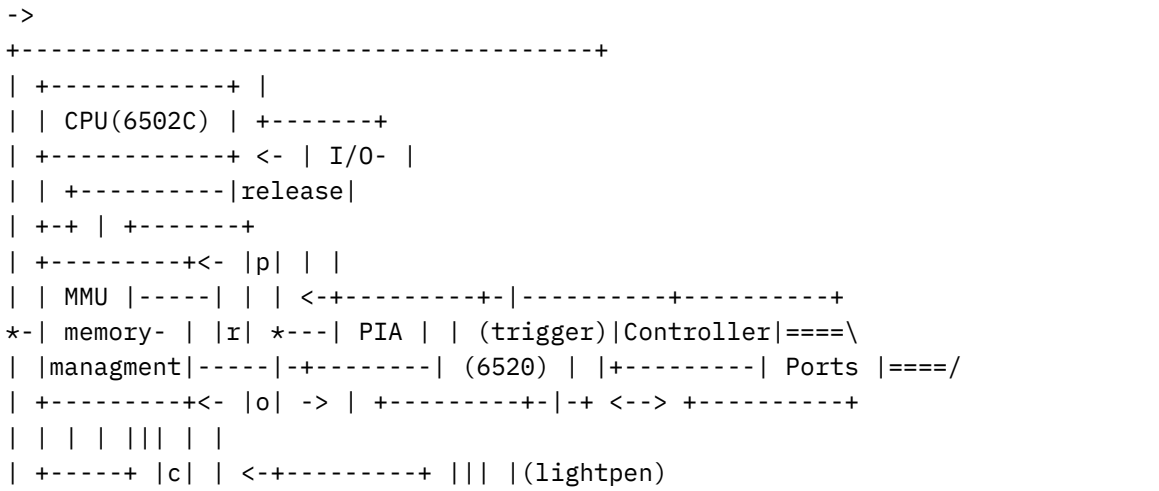
most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missle graphics, and collision detection.

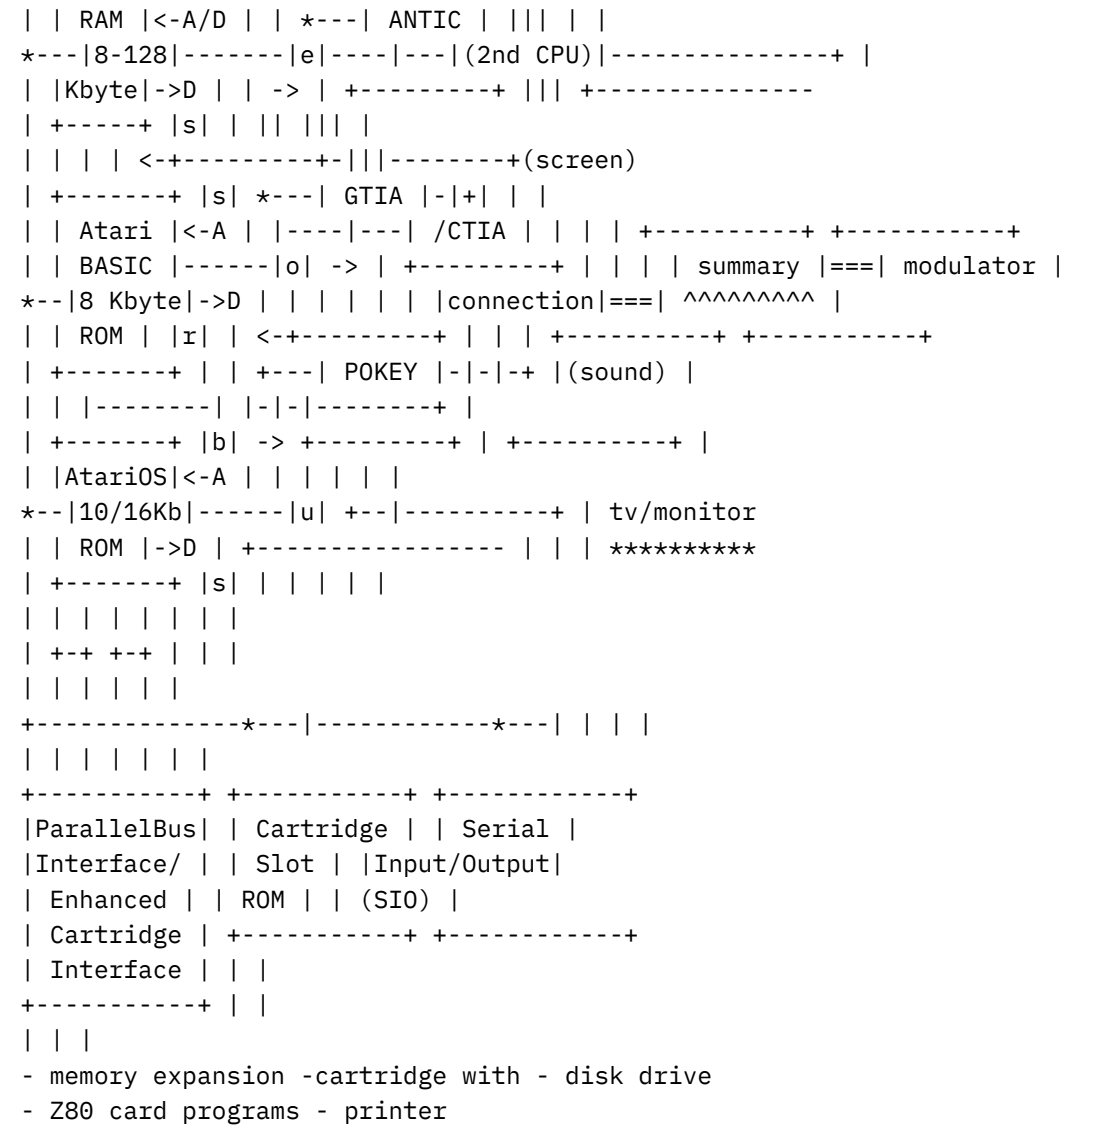
POKEY is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

The 130XE and XEGS contain a small additional LSI called FREDDY, a RAM address multiplexer. According to mailto:sup8pdct@closer.brisnet.org.au (James Bradford), "FREDDY is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. FREDDY also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a FREDDY but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from FREDDY, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to FREDDY for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say FREDDY does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO FREDDY) and an extra 8 RAM chips."

Hardware Arrangement (With thanks to mailto:peter@soemtron.sb.sub.de (Peter))





- memory expansion -cartridge with - disk drive
- Z80 card programs - printer
- 80 char card (games , dos) - modem

NOTES
* RAM: 400/800:8/16/48K,1200XL/800XL/65XE/800XE/XEGS:64K,600XL:16K,130XE:128K
* ROM: 400/800:10K OS, 1200XL:16K OS, all others:16K OS + 8K Atari BASIC
* CPU: 400/800:6502, all others:6502C
* 800 includes two Cartridge Slots, all others include one
* early release 400/800 have CTIA instead of GTIA
* 400/800 have 4 Controller Ports, all others have 2
* PBI is on 600XL/800XL only
* ECI is on 130XE/800XE only

Subject: 1.5) How did Atari get it's name?

Graham Thornton, mailto:dangermouse@prodigy.nospam.net types:

This article was published in "I/O - The Magazine of the Atari Home
Computer Club" in issue 3 - Summer 1983. The magazine was the official

mouthpiece of Atari UK. The article was not attributed to any one person. The words are thiers, not mine.

How Atari Got It's Name

The name Atari actually comes from Japan. And yet the company is most definitely American. Every wondered why? It's an interesting story and one well worth telling.

In 1972 three friends decided to invent and market the first commercially feasible video game. They were Nolan Bushnell, Ted Dabney and Larry Bryan.

To become a partner each man had to submit $100 to the project - a remarkably small sum when you consider the company's success! The next step was to find a name.

Drinking beer and thumbing through the dictionary one day, the three friends came across an interesting entry under "S". The word was Syzygy, or "the straight-line configuration between three celestial bodies". What a perfect name they thought, for three such astronomically talented people!

Now they could get on with the business of inventing games. Their first, Computer Space, was produced and all seemed to be going well.

But then things started to get a little shaky. Larry Bryan decided not to ante up his $100 and pulled out, leaving Bushnell and Dabney to go it alone.

The set up a shop in Santa Clara, California, and incorporated the business. A little later they invented Pong(r).

Busnell and Dabney applied for the name Syzygy to the Office of the California Secretary of State, which regulates Californian corporations, but were told that they were too late. The name was already taken.

Following unsuccessful attempts to buy the rights to the name from the first Syzygy corporation, which appeared to be inactive, the friends' solicitor pressed them to think up an alternative.

This proved difficult. BD Inc and DB Inc were tested and then rejected in turn: the first bore too close a resemblance to Black & Decker, the second to Dunn and Bradstreet.

Inspiration occurred at last, once again in an informal atmosphere. Bushnell and Dabney were both keen players of Go, a Japanese strategy game, and their best brainstorming always occurred over a good game and a bottle of beer.

This time, they decided to make a list of several Go words to see if one of them would fly as the new corporate name.

First choice was "Sente", which means "the upper hand" - something that greatly appealed. Second and third choices were "Atari", which has a similar meaning to the English word "check", and "Hanne", an

acknowledgement of an over-taking move.

Busnell and Dabney submitted the list once again to the Office of the Californian Secretary of State, which approved "Atari". The rest is history.

When the company name changed, Bushnell and Dabney decided to update the logo too. They incorporated the "S" from Syzygy and the "A" from Atari into the new design, and if you look at the middle logo [MLOGO2.BMP], you will be able to make out both letters.

It was not until later, as the company became increasingly successful, that an advertising agency designed the slicker and now famous Atari logo - the "fuji" or stylised "A" design.

Subject: 2.1) What is comp.sys.atari.8bit?

news:comp.sys.atari.8bit is the unmoderated Usenet newsgroup for discussion about the Atari 8-bit family of computers, including the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE and the XE Game System!

comp.sys.atari.8bit was born around 1986 when the earlier comp.sys.atari newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st.

Large binary posts do not belong in unmoderated discussion groups like comp.sys.atari.8bit. If you wish to share PD/freeware/shareware, use alt.binaries.atari and alt.binaries.atari.d or upload the software to the University of Michigan Atari Archive.

To the best of my knowledge, there is no charter for comp.sys.atari.8bit, presumably because the custom of drafting charters for new newsgroups did not exist at that time.

Subject: 2.2) What other Usenet newsgroups cover the 8-bit Atari?

news:comp.sys.atari.advocacy
Opinionated discussions about Atari computers. Unmoderated.

news:comp.sys.atari.announce
Announcements related to Atari computers. Dead newsgroup?
Moderated by Yat Siu, mailto:lexicor@world.std.com

news:comp.sys.atari.programmer
Programming Atari computers. Unmoderated.

news:rec.games.video.classic
Orphan home video game systems. Unmoderated.

news:comp.emulators.misc
Emulating one kind of computer on another. Unmoderated.

news:comp.emulators.announce
Announcements related to computer emulators.
Moderated by Qualcomm, mailto:emulators-request@qualcomm.com

news:alt.binaries.atari
uuencoded software for Atari computers. Unmoderated.

news:alt.binaries.atari.d
Descriptions/discussions on software posted on alt.binaries.atari. Unmoderated.

news:alt.binaries.comp.atari8bit
uuencoded software just for the 8-bit Atari. Not widely available.

Subject: 3.1) What is INFO-ATARI8?

INFO-ATARI8 is an e-mail list for discussion about the Atari 8-bit family of computers.

To subscribe to INFO-ATARI8, send a message to:
mailto:listserv@vm.marist.edu
that says:
subscribe info-atari8

Owner= HARRY@MARIST (A Harry Williams)

comp.sys.atari.8bit postings no longer appear in INFO-ATARI8.

INFO-ATARI8 was created on December 9, 1986.

Subject: 3.2) What is the Classic Computers List?

The Classic Computers List is a discussion list for people who collect/preserve/restore old computers of any kind. If you would like more info you can find it at http://weber.u.washington.edu/~bcw/ccl.html .

If you don't have access to the web, then send an e-mail to mailto:bill@booster.u.washington.edu (Bill Whitson, ClassicCmp ListOp).

On the web site you'll find information on how to subscribe in addition to the two ClassicCmp FAQs. If you decide to subscribe, please read all three documents first.

Subject: 3.3) What is ATARIPL?

From: Wojciech Hartman <harti@waw.pdi.net>
Date: Saturday, March 15, 1997 3:51 AM

I am proud to announce that there is a mailing list "ataripl" for all polish-speaking Atari users and enthusiasts.

To subscribe the lists you have to send an email to
mailto:majordomo@piwo.bl.pg.gda.pl containing a line "subscribe ataripl".

Subject: 3.4) What is ATARI8-L?

atari8-l mailing list

created especially for discussion about ANIX project (unix for atari8),
but any atari 8bit related threads are welcome. english language only.

to subscribe, please mail a message to
mailto:majordomo@zwieracz.pse.pl

containing a line:

subscribe atari8-l <mailing address you'd like to receive the list to>

in the body (not the subject) of your message

there is also mail2news gateway that translates all postings on the
list to easy to read usenet articles, available read-only to everyone at:
news://zwieracz.pse.pl/listserv.atari8-l

if you get any problems, please report to
maciej grzeszczuk, mailto:krap@zwieracz.pse.pl

Subject: 3.5) What is ATARI8PL-L?

any atari 8bit related threads are welcome. Polish language only.

to subscribe, please mail a message to
mailto:majordomo@zwieracz.pse.pl

containing a line:

subscribe atari8pl-l <mailing address you'd like to receive the list to>

in the body (not the subject) of your message

if you get any problems, please report to
maciej grzeszczuk, mailto:krap@zwieracz.pse.pl

Subject: 4.0) What is XL Search?

XL Search is a new and growing search engine created and maintained by
mailto:kendrick@zippy.sonoma.edu (Bill Kendrick), designed to provide much-
improved access to the various PD/freeware/shareware Atari 8-bit software
archives available on the Internet.

XL Search is located at: http://zippy.sonoma.edu/kendrick/nbs/xlsearch/

You can also access XL Search via e-mail! Send mail to:
mailto:kendrick@zippy.sonoma.edu with the subject "xlsearch" for details.

Subject: 4.1) What is the University of Michigan Archive?

The University of Michigan (UMich) Software Archives hold a huge number of files for many computing platforms, including the Atari 8-bit computers. For more information:

Bill Kendrick, mailto:kendrick@zippy.sonoma.edu (8-bit Atari files)
Mickey Boyd, mailto:boydm@atari.archive.umich.edu (the entire Atari Archive)
Michael Dautermann, mailto:myke@umich.edu (the entire UMich Software Archives)

Downloading

There are numerous methods available for downloading files from the UMich Archive. The Archivists request you use these mechanisms in this order of preference:

1) The number one way to get into the UMich archives is via AFS. If you have AFS, all our files are kept in the directory "/afs/umich.edu/group/itd/archive". If you have AFS, PLEASE USE IT! Specifically, use:

file:///afs/umich.edu/group/itd/archive/atari/8bit/

2) Gophering to gopher.archive.umich.edu and looking under the "Software Archives" choice. Specifically, use:

gopher://gopher.archive.umich.edu:7055/11/atari/8bit/

There are also mirror Gopher servers:
gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit/
gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit/

3) The WWW interface is fine, at this point. http://www.umich.edu/~archive/ Specifically, use:

http://www.umich.edu/~archive/atari/8bit/

Mirror web sites:
http://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
http://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/

4) FTPing to atari.archive.umich.edu and looking in the "8bit" subdirectory. Specifically, use:

ftp://atari.archive.umich.edu/atari/8bit/

The atari.archive.umich.edu FTP site is chronically overloaded, but there are several mirror sites which are all updated from the home site regularly:
ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/
ftp://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit/

ftp://barnone.citi.umich.edu/atari/8bit/
ftp://ftp.kendall.mdcc.edu/pub/atari/umich.edu/8bit/
ftp://ftp.toad.net/pub/umich/8bit/
ftp://pmftp.cs.vu.nl/pub/atari8bit/

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

5) E-Mail <-> FTP gateways. See the section of this FAQ list entitled "How can
I retrieve files from FTP sites by e-mail?"

Uploading

General uploading tips:
- No uploads may be made to the Archive's mirror sites.
- Please also upload a short text file describing what your upload is. You
might also suggest what permanent 8bit subdirectory you'd like your file to
end up in.
- Note that the 8bit/New directory is "write-only."

1) upload via AFS:
Just copy files into file:///afs/umich.edu/group/itd/archive/atari/8bit/New/

2) upload via FTP:
FTP to atari.archive.umich.edu, cd into "8bit/New", and upload your files.

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

3) upload via E-Mail:
Simply uuencode the file and mail it to mailto:kendrick@zippy.sonoma.edu
(Bill Kendrick).

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by mailto:eyvind@stud.unit.no
(Eyvind Bernhardsen). PVV stands for ProgramVareVerstedet, or The Software
Workshop, a student society at the University of Trondheim, Norway.

ftp://ftp.pvv.unit.no/pub/atari/8bit/ (129.241.210.232)

Uploads go to /incoming/atari/8bit; Eyvind will move them to the appropriate
directory. Please include a readme file with each upload, so people know
what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

A mirror of Kevin Atkinson;s ClarkNet Archive, kept by Jason Duerstock:
ftp://ftp.kendall.mdcc.edu/pub/atari/clark.net/ (147.70.146.36)

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atari
8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The
Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is the Polish Demo Archive?

It's a place when you can get all Polish (not only) demos (not only)
on a Atari 8-bit.
If You have any comments, write to:
mailto:LukSoft@hipokrates.am.lublin.pl

ftp://hipokrates.am.lublin.pl/sys/pub/atari8/

Subject: 4.7) What is the Atari 8bit FTP Archive in Slovakia?

This FTP site contains demos, games, utilities, zines and other useful stuff
from all the world. Also, you can download big amount of slovak and czech
programs for 8bit Atari only from this archive. And finally, because this
site is created and supported by slovak computer group GMG, most of our
products can be found right here.

If you want to place here your program, just send it to me (with some
comment) by e-mail and I will do the rest.

If you have some problems or questions, please contact me at this address:

mailto:mchorvat@econ.umb.sk (Marek Augustin Chorvat)

ftp://svs.scsss.sk/pub/atari

Subject: 5.1) What is the Cleveland Free-Net Atari SIG?

Internet access to the Cleveland Free-Net (Cleveland, Ohio, USA):

telnet://freenet-in-a.cwru.edu or
telnet://freenet-in-b.cwru.edu or
telnet://freenet-in-c.cwru.edu

Type "go atari" at any menu.

Contact:
mailto:xx004@cleveland.freenet.edu (Atari SIG)

The Cleveland Free-Net now has a home page:
http://cnswww.cns.cwru.edu/net/easy/fn/

Subject: 5.2) What is the National Capital FreeNet Atari Users SIG?

Internet access to the National Capital FreeNet (Ottawa, Ontario, Canada):

telnet://telnet.ncf.carleton.ca (Type "go atari" at any menu) or
gopher://gopher.ncf.carleton.ca or
http://www.ncf.carleton.ca/

Contact:
mailto:ac382@freenet.carleton.ca (Jack Kitowicz) or
mailto:aa728@freenet.carleton.ca (Blair Dea)

Subject: 5.3) What is the Victoria Telecommunity Network Atari Users SIG?

Internet access to the Victoria Telecommunity Network (Victoria, British
Columbia, Canada):

telnet://freenet.victoria.bc.ca (Type "go atari" at any menu)

Contact:
mailto:ua558@freenet.victoria.bc.ca (Gordon Hooper) or
mailto:ud264@freenet.victoria.bc.ca (Ted Skrecky)

Subject: 7.1) What WWW pages support the 8-bit Atari?

This should be a complete list of WWW pages supporting the 8-bit Atari.

Subject: 8.1) What IRC channels discuss the 8-bit Atari?

==> #atari8 - Just for 8-bit Atari users!

==> #rgvc - Classic Games and Systems Collectors. "Rec.Games.Video.Classic"

mailto:cmwagner@gate.net (Chad Wagner) writes:

If you have access to a Unix host then you should be able to get to irc by
typing irc at your shell prompt and jumping on an EFnet server
(irc.portal.com, irc.eskimo.com, dewey.cc.utexas.edu) and joining #atari8.

If you are using a host that has a menu system then locate IRC and go there,
and join #atari8 (and hope your on EFnet, :).

If you are using SLIP/PPP then download a client (for Windows users, download
mIRC for Winsock archives, and I would guess that most SLIP/PPP users -- if
they have gotten that far -- are familiar with IRC, :) and select one of
the servers and join #atari8. There is many IRC servers on EFnet, chances
are the one your on is on EFnet.

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
filenames: Archivers/uudecode.bas, Archivers/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
filename: Archivers/yau.arc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
filename: Utilities/uue.arc

Dumas UU-coder by John Dunning
filename: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The archives contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
filenames: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc

Subject: 9.3) What are the .DCM, .ATR, and .XFD file formats?

These are all filename extensions used to name files containing entire 8-bit
Atari floppy disk images.

DCM - Disk Communicator format. Invented by Bob Puff,
mailto:76702.1076@compuserve.com for his Disk Communicator 3.2 utility.
Used when working with native Atari hardware.

ATR - Atari disk image format. Invented by Nick Kennedy,
mailto:nkennedy@cswnet.com for his SIO2PC project.
Used when working with non-Atari hardware.

XFD - Xformer disk image format. Invented by Emulators Inc,
mailto:emulators@msn.com for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used when working with non-Atari hardware.

PRO - APE ProSystem format. Invented by Steven Tucker,
mailto:classics@nacs.net for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.

Subject: 9.4) What are the .XMO and .BIN file formats?

XMO stands for XMODEM. The idea was that the file was not plain text, but was a binary file. As a binary file, it had to be downloaded using a file transfer protocol such as XMODEM. The use of ".xmo" as a filename extender was popular once, but has been discouraged for years.

BIN - another filename extension sometimes used to designate binary-load files. Like .xmo, use of .bin is discouraged.

Subject: 9.5) How can I make my commercial boot disk (tape, cart) into a load file or disk image?

Russ Gilbert, mailto:russg@en.com writes:

The disk image part is a matter of taking a copyable boot disk and making an atr, xfd, dcm or other disk image type file out of it, usually for use with an emulator. Before emulators, the Bob Puff .dcm format was used to store/archive/retrieve boot disk images.

Almost all commercial software for the A8 is/was copy protected. For boot disks, this usually involved a large number of special formatting that couldn't be copied using ordinary sector copiers. Usually the boot process involved checking to see if a certain sector error occurred, then proceeding. If the error did not occur, the disk was a copy and would not work.

For carts, usually the method of protection was to write to the cart area of memory and see if the value changed. If the value changed, the cart program was in RAM, not ROM and would fail to operate.

For tapes, again a fair number of schemes were used. Some varied the speed at which the tape loaded. I'm not familiar with tape protection schemes.

With all software media (cart, tape, disk), there may be program encryption, which must be decrypted before the program can run. This to make more difficult disassembly of the program.

There were/are a number of products to defeat copy protection/allow copying of protected software for the A8. The most common way to defeat copy protection was to disassemble the software and revise sections of code so that the copy protection was defeated. A software with defeated copy protection is called a 'cracked' software. The basic procedure is to understand how cart/tape/disk software initializes, loads and runs. Usually make a file out of the

software and 'follow the code', starting with loading of the program, to decryption to the actual running of the program. Today, it is unnecessary to copy original commercial A8 software because it has already been defeated and may be found at a few ftp sites. (Note umich archive has no commercial/non-shareware software.)

Besides 'cracking' software, there were/are hardware devices to copy commercial protected software. The Happy 1050 and the Archiver, and probably other modifications to the 810, or 1050 allowed 'bit image' copying and reproduction of the special formatting that copy protected disks had. Using these archiving disk drives, a copy of the original disk, including all special formatting and the original code is copied, thus making a copy protected copy, not cracked, just like the original.

For carts, copying could involve cracking or again there were/are products to reproduce the cart and simulate a ROM. Or the cart might be copied and burned on the correct type of eprom, to make a plug in cart. 'The Impersonator', the 'Pill' are two cart copy schemes copy the cart to a file, then don't change the code, but use a 'dummy cart' to fool the software into thinking there is a ROM present.

Basic tools for copying, then cracking, carts and disks are a sector editor and disassembler. Carts are usually most easily dumped using a special OS, like Omnimon, to interrupt the cart and dump memory to disk. There are a few pd cart copiers that have the user plug the cart in when the program is running, I don't believe these pd cart copiers are very good or very wise to use.

So, the basic answer to 'how do I make a copy of my copy protected commercial software' is don't bother. Find it on the net.

There is one exception, in that this 'solution' involves a minimum of effort and is relatively safe. I refer to 'Chipmunk' and 'Black Patch' software to make cracked boot disk copy of commercial disks. HOWEVER, even if you use these two commercial archival tools, be sure you write protect your originals, and be careful not to accidentally write to the original disk.

Finally, I'll mention a very modern (I mean 1997) product. The APE Pro system, by Steven Tucker, in the registered version of this shareware allows making disk images called 'Pro' images. APE (Atari Peripheral Emulator) requires a cable, called the SIO2PC cable, that connects the A8 13 pin serial port to a serial port on the IBM PC clone. To make 'Pro' images, a special adapter cable is needed, not just

the 'standard' SIO2PC cable. The 'Pro' image can 'capture'
the copy protection of an original commercial disk. The
'Pro' image can then be loaded into an A8 using the APE
registered version software, thus backing up your original
disk software. Note the 'Pro' image will only be of use to
person(s) owning registered APE software and 'Pro' adapter
cable.

Subject: 9.6) How can I convert my commercial boot tape into a cassette
image file?

mailto:ernest@pi.net (Ernest R. Schreurs) writes:

For those of you that like ALL classic Atari software, there is now a
way to store all software that has been recorded on cassette tapes on
the hard disk of your PC. I have written a program that is similar to
the SIO2PC utility written by Nick Kennedy. But this one is intended
for use with cassette software. You will need the following items:

Any PC equipped with a sound card and about 50 to 100 Megs of free
disk space to work with. The sound card should be able to sample sound
at a sample rate of 44.100 Hz mono. The sample must be recorded into
a .wav file.
You need the wav2cas program to convert the .wav file to a .cas file.
The .cas file is a digital cassette image file that only contains the
data that is on the cassette tape. Once you have that, you can throw
away the .wav file. The .cas files are typically 16 to 64K, so they
are relatively small.

To load cassette files into your Atari (i.e. boot a digital cassette
image) you do not need a sound card. You do need a SIO2PC cable or
similar device. You also need the cas2sio program.

The wav2cas and cas2sio programs should be available from the archives
of Umich by now. They have been put together in one zip file
wav2cas.zip, along with the documentation and the 'C' source code.
You can download it through the web interface at the URL
http://www.umich.edu/~archive/atari/8bit/Emulators/Peripherals/wav2cas.zip
Note the capital in Emulators and in Peripherals.
Thanks to William Kendrick for helping me get it uploaded there!
You can also try the gopher stuff:
gopher://gopher.archive.umich.edu:7055/11/atari/8bit/Emulators/Peripherals/

Steven Tucker, the author of APE, has added support for this file
format as of version 1.15 of APE. It looks real neat, so try that out
too! Thanks to Steven for adding a nice user interface for these
cassette images. He did a nice job. I am hoping other using are
willing to write some programs to get more enjoyment out of this
underrated storage medium.

My stuff is available totally free for personal use, so I hope you
enjoy it. Read the docs about the conditions.

Keep those XL's/XE's humming.
If you have any questions feel free to E-mail me: mailto:ernest@pi.net

---

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

Ice-T XE v2.72 (128K XL/XE) or Ice-T 800 v1.1 (48K)
shareware by Itay Chamiel, mailto:itayc@hotmail.com
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: X/Y/ZMODEM download
Autodial: Yes (2.72) or No (1.1)
Backscroll buffer: Yes--8 screens (2.72) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.72) or No (1.1)
Summary: Outstanding flicker-free high-speed VT100 emulation.Recommended!
http://www.geocities.com/Hollywood/Lot/4205/

FlickerTerm 80 v.0.51, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus

BobTerm 1.22, shareware by Bob Puff
(There's also a 1.23 that's specific to PC XFormer)
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; best for BBSing
filename: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation

Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Only option combining VT100, XMODEM, Kermit; buggy at file Xfers
filename: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Only option for VT100 emulation on the XEP80; 1200bps top speed
filename: Telecomm/vt850b1.arc

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
filename: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
filename: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
filename: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett with Mark Vallevand, and
SpartaDOS disk utility by Mark Vallevand
filename: Diskutils/myutil.zip
includes best version of UTIL for read/write of SS/DD 180K Atari disks,
plus Mark's SpartaDOS disk utility v0.1e to access 180K SpartaDOS disks

MyUTIL and the XF551 - tips from mailto:JTKIRK@urp.edu.pe:

]MyUtil works fine with the XF551. The XF551's speed is 300 rpm (sometimes even
]up to 303 rpm). I've got two XF551s and can read/write disks written on a PC
]with MyUtil on both with no problems. MyUtil even can write to a DS/DD disk,
]for a total of 360 K, BUT: the ATARI disks not only have the bits inverted,
]the second side is also read BACKWARDS respect to PC disks. That is, when
]MyUtil on the PC writes to what it thinks is sector 721, it really is writing

]to sector 1440! Worse, if you take an ATARI disk with a file whose sectors
]get past sector 720, MyUtil will attempt to read the sector 2161-n instead of
]'n', and you'll get a 'truncated record' error. The solution is simply to
]rewrite the code to take into account this (if sec>720 then sec=2161-sec).
]Let me know if you modify this. You don't know how frustrating it is to have
]to use only 180 K of a 360 K disk! I'm going to analyze the source code, but
]I don't know if I will be able to modify it properly. If someone does it
]before, please email me and send me an uuencoded copy or tell me where to get
]it.

Here's some advice on using the above utilities from mailto:hans@umd5.umd.edu
(Hans Breitenlohner):

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (288 rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)
Konrad Kokoszkiewicz, mailto:draco@mi.com.pl answers:
"The XF551 disk drive is not slowed down - these drives are spinning
300 rotations per minute. To prevent troubles with read/write disks
formatted and written on normal Atari drives (288 rot/min), the main
crystal frequency for the floppy disk controller is 8.333 MHz
(not 8 MHz, as in 1050, for example)."

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo, mailto:ssilicon@lax.net sums it up this way:
So a basic rule of themb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of

course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
filenames: Xf2/anad207.zip, Xf2/anadisk.txt
Deana by Nate Monson - converts AnaDisk dump files from Atari format
filenames: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:crow@cs.dartmouth.edu (Preston Crow),
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
filenames: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 11.5), can be
used to read/write to a hard drive connected to an MS-DOS system. This
can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the
companion vendor/developer list) allow the Atari XF551 disk drive to read
720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software
Services (see the companion vendor/developer list), allows both low
density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe
Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard
floppy drives to be used on the Atari. A utility is included to
read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on each computer. The RS 232 ports need to be connected together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. (Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25-pin port.)

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go from #1 on the right to #13 on the left on the 'long' side and from #14 to #25 from right to left on the 'short' side. #25 is closest to being under #13. A male connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a male DB9 to male DB25 modem cable to connect to your modem. So why not use this cable as your null modem cable as well?

For higher speed connections, above about 9600 bps on the 8-bit, you need the flow control lines. You also need a Multi I/O or Black Box, which use the PBI (parallel bus), then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C port.
13 1
o o o o o o o o o o o o o
o o o o o o o o o o o o o
25 14

(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed
but also pins 4 and 5 as well as 6 and 8. Or better
yet, make a true 25 wire, straight through cable and use
a commercial null modem. A commercial null modem is
just a small device with the correct lines already
crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

Subject: 11.5) What is SIO2PC?

Original text by Dave Paterson, mailto:davepat@total.net

SIO2PC is a cable and software combination that lets you use your PC as up
to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to
16 megs. SIO2PC also lets you redirect the printer output to your PC
printer or to a file on the PC. High speed drives are emulated (a la US
Doubler).

All these functions are transparent at the Atari end; you never notice the
difference between SIO2PC and regular drives, except that the SIO2PC drives
are faster than any others (except Ramdisks and PBI interface drives).

Several different designs for the SIO2PC hardware are floating around. Best
contact the author for the latest details.

SIO2PC 4.16 is shareware by Nick Kennedy, mailto:nkennedy@cswnet.com

---

Subject: 12.1) What 5.25" floppy disk drives are available?

==> Trak ATD2
SS SD/DD
Built in Diagnostics. Track indicator. Write protect switch. Built in
parallel printer interface. 2k printer buffer (expandable). Optional
Turbo software on Eprom.

==> Trak AT-1
SS SD/DD Slave

==> Indus GT
SS SD/ED/DD Synchromesh mode usable with SpartaDOS X and
DOSXL only.

==> Astra Double-D?
SS/DS SD/DD? standard /LEDs and such

==> Rana 1000
SS SD/ED/DD standard /LEDs and such can format disks on a
stand alone basis

==> TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive
has number D1:) or D4: (when drive has number D2:). It makes possible load DOS
from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- Ultra Speed - 70000 bps
Also tracks buffering.

==> AS SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

==> TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)
Transmition modes:
- standard 19200 bps
- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- Ultra Speed (QMEG-OS, SpartaDOS) - 67000 bps
Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY

- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic
- AUTORUN.SYS - ramdisk
- README
Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

==> LDW Super 2000
SS SD/ED/DD 19200 bps or 67000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA2001
SS SD/ED/DD 19200 bps or 38400 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA2002
SS/DS SD/ED/DD 19200 bps, 70000 with SpartaDOS
CPU 8040, ROM 4 KB, RAM 256 B

==> Floppy board various
Any standard very fast parallel
DOS-transparent. Requires Black Box. DS system configurable for
XF Percom or ATR style

==> HDI various
Any standard very fast SIO? European

==> SWP ATR-8000
Any standard standard except 1.2 meg and unique DS system
(HD) nice Z80 CP/M system in which CP/M drive acccess is parallel only
thus faster.

==> Atari 1450XLD drives
DS SD/ED DD? standard, requires DOS4. unusual DS system
Only prototypes exist.

==> KARIN MAXI
Double head disk drive 360 KB/5,25" or 720 KB/3,5", controller WD 1772.
Available formats:
= standard SS/SD 90 KB
= standard SS/ED 130 KB
= standard SS/DD 180 KB
= 'cylindric' DS/DD 360 KB (XF-551 uncompatible)
= 'cylindric' DS/QD 720 KB (TOMS-compatible; 720 KB drives only)
Any other capabilities depend on a special software.
Transmission mode:
- parallel: real speed 11.25 kilobytes per second with DOS or 22.5 kilo-
bytes per second with special track-copier.
Notes:
Because of the 1772-registers available in 6502 i/o pages ($D100),
the KARIN MAXI drives look full-programmable.

Preferred systems: MYDOS, SDX.

==> XFD-601B
Double head 360 KB/5,25" disk drive. Controller WD 1772, CPU 8051.
Available formats:
- standard SS/SD 90 KB
- standard SS/ED 130 KB
- standard SS/DD 180 KB
- standard DS/DD 360 KB (XF-551 compatible)
Transmission modes:
- normal 19200 bps
- Top Drive 1050 70000 bps
- Indus GT (synchromesh) 70000 bps (GTSYNC.COM and INDUS.SYS are not necessary;
full-compatibel with the SDX)
- Ultra Speed 70000 bps (full-compatible with the older SpartaDOS)
Notes:
Customized sector skew. In fact, the XFD-601B is a original clone of the
XF-551.

==> XFD-602B
The two XFD-601B drives in the one unit.

Subject: 12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

- Amdek
- XF551 upgrades (CSS)
- Floppy Board (CSS)
- Percom drive upgrades

==> Atari XF351 or XC35
3.5" system Unreleased

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

For starters, you'll need to obtain one of the following interfaces:

==> Corvus hard drive (10 megabytes)
Rare.
Fast but still relatively slow I/O, kludge through joystick ports for 800.

==> KPI Hard Disk Drive Interface (formerly Supra)
from K-Products (bobkla19@mail.tcd.net - Bob Klaas)
Some limitations on drive type and size and total number of drives in sys.

==> Multi I/O (MIO) (formerly from ICD)
from Fine Tooned Engineering (FTe) (ftooned@crl.com - Mike Hohman)
256 byter per sector restriction. 256K and 1 meg ramdisk models.

Printer and modem, modem will handle 19.2K bps

==> Black Box
from Computer Software Services (CSS) (76702.1076@compuserve.com - Bob Puff)
Will handle all SCSI drives. Allows 9 drive access for MYDOS. Currently the
only modem interface with CTS/RTS hardware flow control. 19.2K ready.

==> SWP ATR-8000
Rare daughterboard for hard drives.
I/O is probably fairly slow on this baby and there may be DOS restrictions.

==> IDE Hard Drive Interface
from Konrad M. Kokoszkiewicz and Jacek Zuk
(see http://www.orient.uw.edu.pl/~conradus/docs/ide_eng.html)
o Maximum drive capacity: 16777215 physical blocks on each device.
o Maximum number of partitions: 16
o Maximum capacity of a partition: 16777215 logical sectors
o Logical sector length: 256 or 512 bytes
o Average speed (in kilobytes per second, WDC 130AB drive):
- Native mode, sequence of sectors (R): 75
- Emulation mode, sequence of sectors (R): 43
- Emulation mode, back sequence (R): 28
- Emulation mode, random sectors (R): 13
- Emulation mode, same sector (R): 29
- Emulation mode, DOS file (W): 7
- Emulation mode, DOS file (R): 36
o Booting from any partition (on the standard XL OS)
o Write protection capability
o 8 jumpers to set the device number for the operating system
o Sweet 16 compatibility

==> Fine Tooned Engineering Multi I/O II
An IDE interface. Released?

==> MSC IDE-Harddisk-Controller
created by Steve Birmanns and Matthias Belitz in Germany
mailto:stefan_birmanns@ac.cybercity.de
mailto:matz@kawo2.rwth-aachen.de
http://www.kawo2.rwth-aachen.de/~matz/atari/
* real device for the parallel-port of the Atari XL-Series
* up to 240 partitions per harddisk supported
* emulates D1: until D9: of disk devices (access to 9 partitions at
one time)
* full bootable from any partition (with standard XL-OS)
* write protectition capability
* supports master/slave configuration
* more than 30 KB/s file access with SPARTA-DOS 3.2 gx (reading)
* more than 10 KB/s file access with SPARTA-DOS 3.2 gx (writing)
* access of ATAPI-CDROM with additional software

Subject: 12.4) What kinds of monitors can I use with my Atari?

In general, you either need a Composite Video monitor, or a standard TV.

Television:
You'll need a video cable (not detachable on the 400/800), and a TV Switch Box. Used with VHF Channel 2 or 3.

Monitor:
The 8-bit Atari produces a color Composite Video signal, plus separate chroma (color) and luminance (brightness) signals which the best composite video monitors can take advantage of. Popular examples of such monitors include the Commodore 1702 and 1804 (and many others).

The pinout of the Monitor port is in the pinout section of this FAQ list.

Gotcha's:

-the 400 and North American 600XL lack a monitor port entirely. They can only be used with a TV.

-the 800XL lacks separate chroma/lumi (can be added via hardware modification)

-the XE Game System provides an RCA-style jack in place of the Monitor port; so it provides Composite Video but lacks separate chroma\lumi signals

-the XEP80 Interface Module produces a monochrome Composite Video signal via an RCA-style jack. This higher-resolution signal produces crisp, clear 80 column text on 80-column monochrome composite video monitors.

mailto:buesch@srv.net (Brent Buescher, Jr.) writes:

"The best monitor for an Atari 8 bit that is readily available today would be a television with an S-video input---these tend to be large and high-quality, so the s-video input is the deciding factor there. You'll have to build the cable yourself, and if you have an XL you'll want to do the Super Video upgrade that Ben Poehland published in Atari Classics a few years ago---this puts the chroma signal back on the pin that it should be and cleans up the video signal enormously. It's really more of a fix than an upgrade.

I use a commodore split-video monitor. They work great and are cheap-to-reasonable when you can find them."

Jerry Jessop, mailto:jjessop1@home.com explains why French Ataris produce fewer colors:

"I will tell you why it only has monochrome out, because it's SECAM and a SECAM GTIA was never produced. The PAL GTIA is used in France and the Lum outputs are run into an onboard encoder to produce a "psudo" color depending on the Luminance output, composite only. This is why a SECAM VCS or 800 has nowhere near the same number of colors (16) availible as a PAL or NTSC unit (256).

The FGTIA was never completed as the market size did not warrant the expense. The largest SECAM market is not France but the Soviet Union (former) and in 80-84 sales of these items there were not possible."

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system.

Either MYDOS or SpartaDOS will work with almost any disk drive, up to 8 drives or hard disk partitions, and ramdisk.

MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff). There are two versions of MYDOS 4.53, one uses 3 digit sector numbers where possible, known as 4.53/3; the other, known as 4.53/4, uses 4 digits minimum. Complete documentation about the disk formats and commands, as well as the source code, is available.

SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g and 3.2gx are disk-based; SpartaDOS X 4.22 is cartridge-based and includes many additional features. SpartaDOS is available from Fine Tooned Engineering (see companion vendor/developer list). SpartaDOS 3.3a and 3.3b were rewritten by Stephen J. Carden for use with BBS Express PRO!.

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
filenames: Os/dos25.arc (DOS 2.5)
Fte/fte32g.arc (SpartaDOS 3.2g)
Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Another popular, powerful DOS is BW-DOS, freeware by Jiri Bernasek.
BW-DOS 1.30 and all other versions are available via:
http://atari.boss.com.pl/files

Any other versions of DOS all 8-bit Atari users should be aware of??

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Home Computer (1979) 8/16K, membrane keyboard, 400/800 OS
800 Home Computer (1979) 8/16/48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
65XE Personal Computer (1985) same as 800XL minus PBI
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
800XE Personal Computer(1987?)same as 130XE but 64K. Mostly eastern Europe.
XE Game System (1987) same as 65XE plus Missile Command, detach keybd

Peripherals:
410 Program Recorder -Japan and Hong Kong versions. 410a - Taiwan
version
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 40-Column Printer -
822 Thermal Printer -40 col.
825 80-Column Printer -req. 850
830 Acoustic Modem -300 baud req. 850, with Telelink I software
835 Direct Connect Modem -300 baud, with Telelink II software
850 Interface Module -4 9-pin serial, 1 15-pin parallel ports, beige &
black metal versions
1010 Program Recorder -Sanyo and Chelco versions
1020 Color Printer -40 col.(80 by command) print/plot in 4 colors
1025 80-Column Printer -7-pin dot matrix
1027 Letter-Quality Printer-80 col. letter quality =Mann-Tally Riteman LQ
1029 Printer -7-pin dot matrix, same as Commodore MPS-801
1030 Direct Connect Modem -300 baud, with ModemLink software. 2 SIO ports
1050 Disk Drive -SS/ED 128K with DOS 3 or DOS 2.5
1064 -64K RAM module for 600XL
XC11 Program Recorder
XC12 Program Recorder
XM301 Modem -300 baud, w/ XE Term software. Permanent SIO cable
XMM801 Printer -80 col. Ribbon: Mannesman/Tally MS80
XDM121 Printer -80 col.letter quality. Ribbon: Silver Reed CF130
XF551 Disk Drive -DS/DD 360K with DOS XE
XEP80 Interface Module -80 col. video display and DB25 parallel port
SX212 Modem -1200 baud, rarely with SX-Express! package

Atari 8-bit vaporware computers: (note some are more vaporous than others)
800D (Developers Bus System)
600 600XL, all black case
1000 Sweet 16 Project, lower end model. Became the 1200XL
1000-X Sweet 16 Project, higher end model. Became the 1200XL
1200 1200XL internally, many slight cosmetic differences
1200XLS 1200XL Show prototype, top-mounted cartridge slot
800XLF late 800XL with a redesigned motherboard, plus the FREDDY chip
1250XLD Earlier name for the 1450XLD
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL 1400XL plus room for 2 internal 5.25" floppy drives
1450XLD 1400XL plus 5.25" floppy drive
1600XL Amiga/Amiga-like????
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE/AMY sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D
1055 -a 1050 (SS/ED) with a 3.5" mechanism
1060 CP/M Add-On Module -Z-80 CPU, 64K RAM, CP/M 2.2 OS, 80 column display
1090 XL Expansion System-5 PBI slots, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style

XF351 -a 3.5" drive.
XC35 -an XF551 with a 3.5" mechanism
XTM201 -non-impact printer
XTC201 -non-impact color printer

Subject: 13.3) What are the power-supply requirements for my Atari components?

Thanks to Matthias Belitz, mailto:matz@kawo2.rwth-aachen.de for the European data in this section. I need more international help!

As with the rest of this FAQ list, please let me know if any of this information conflicts with the units you have.

The most important information is the voltage (in volts) required, and whether you need a transformer (AC output) or an adapter (DC output). The power (in watts) and current (in amperes) specifications of the original equipment as presented here should be regarded as minimum values. Higher-than-specified power and current capacities are entirely usable, and often preferable because such supplies run cooler and last longer.

Relevant law of physics:
Power (in watts) = current (in amps) * voltage (in volts)

N O R T H A M E R I C A: INPUT = 115-120 V AC, 50/60Hz

5 V DC 1.5 A (7.5 W) #CO61763-11 : 65XE,800XL,800XE
two ones with the same part number, but different cases and different
input Values :#1, 65XE (Poland, made in Taiwan), Input 22 VA
#2, 800XL, Input 26 VA
9 V AC 27 VA (3.0 A) CO60592-34 : 1050
9V AC 0,5 A, CO#61516 : 1010
9,3V AC, 1,66 A CO# (not printed), FW 6799: 800

These draw their power from the SIO +5 V:
XM301 (60 mA),XC12,ICD/FTe P:R:Connection

Draws power from the 600XL PBI:
1064

These have built-in power supplies (plug directly into the wall):
410,815,820,825,1025,1029,XMM801,XDM121

The power supply requirements for the following are still needed:
??? V DC ???? A (???? W) Atari#CA060535 adapter:
835

XC11 program recorder (no brick needed -> internal or SIO source?)

OTHER:
The ICD/FTe Multi I/O (MIO), all versions, can use both AC and DC supplies.
But stick to voltages of at least 6.2-7.2 V.

Subject: 13.4) What are the pinouts for the...?

Subject: 13.5) What BBS software can be used on the Atari?

This section mostly by mailto:winston@merk.com (Winston Smith)

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
This BBS was written in BASIC by the Atari Computer
Enthusiasts computer club (was it the Michigan chapter?). It included
designs for a ring-detector. You needed a sector editor and had to
allocate message space by hand, hex byte by hex byte.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas were
added the name was extended to FoReM 26M. Then, When OSS released BASIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most
of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the
Atari 8-bit has been placed into the public domain or not. This BBS was
the first to support a RAMdisk, which Paul Swanson called a "V:" device
for "virtual disk". This BBS was written in Atari BASIC and required a
joystick hardware "dongle" device. This was notable as being one of the
first Atari 8-BIT BBSes that could actually go for a week without having
to be rebooted. Pointers to the message base were kept in an Atari "very
long string" (for which Atari BASIC is famous). The BBS would only have
problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of
the commercial BASIC XE cartridge to run. This BBS program was very
popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It
expects to be running under a SpartaDOS environment. This was a problem
until very recently, when the disk-based version of SpartaDOS was
re-released as shareware. This BBS program uses a "modem clock string"
rather than an R-Time 8 cartridge in order to retrieve the current time.
It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE
cartridge in order to run. It is in the public domain and can import and
export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only,
control ATASCII graphics are reserved for message data-structure bytes).
FOREM-XE BBS is still currently in use as we speak, and may be reached via
the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in
effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS,
which is the Keith Ledbetter companion project of the EXPRESS!-TERM
terminal program of days gone by. I am not familiar with this program. I
think that it is written in Action! and only supports XMODEM Checksum
transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and
comes with a "dial out" screen so that the Sysop can use the BBS as a
terminal program to call and fetch files without having to bring the BBS
down and reload a terminal program. OASIS supports "Door programs" which
it refers to as "OASIS PAL modules". This OASIS demo module comes with an
excellent message system. The OASIS file system is one of the most
complicated that I have ever seen. It consists of "file libraries" with
suites of "file types". There is quite a bit of overhead involved in
performing a download (which may be a good thing, as it discourages file
hogs). There is a commercial version of OASIS called "OASIS IV" that

performs networking. There was an OASIS network between Boston, Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank Walters wrote it.

o Carina BBS -- a product of Shadow Software. See Vendor list to contact.

o BBS Express! Professional -- a product of K-Products. See Vendor List.

o OASIS IV -- a product of ???

o Forem-XE Pro -- by Len Spencer. http://members.aol.com/lenspencer/

Subject: 13.6) What versions of Atari BASIC or the CTIA/GTIA chip do I have?

Atari BASIC:

At the READY prompt, enter "? PEEK(43234)"

If the result is: You have Revision:
162 A
96 B
234 C

Freddy Offenga, mailto:offen300@hio.tem.nhl.nl adds:

there's another good answer (IMO):

You can also take a look at the part numbers on the IC's inside your Atari and compare them with the numbers from the following table:

Part#	Version
CO12402 + CO14502	A
CO60302A	B
CO24947A	C

CTIA or GTIA installed?

In BASIC, type POKE 623,64 [RETURN] and if the screen blackens, you have the GTIA chip. If it stays blue, you have the old CTIA chip.

By the way, apparently no CTIA-equipped Ataris were shipped to Europe.

Subject: 13.7) Which versions of the Operating System (OS) are there?

This section written by Freddy Offenga, mailto:offen300@hio.tem.nhl.nl

The following Operating Systems exist for the Atari 8-bit:

Rev.	System(s)	Models	Size	Part Nr(s)
A	NTSC	400/800	10kB	CO12499B, CO14599B, 12399B (*)
A	PAL	400/800	10kB	CO15199, CO15299, CO12399B
B	NTSC	400/800	10kB	(?)
B	PAL	400/800	10kB	(?) (*)
1 A	NTSC/PAL	1200XL	16kB	CO60616A, CO60617A
1 B	NTSC/PAL	1200XL	16kB	CO60616B, CO60617B (?) (*)
1	NTSC/PAL	600XL	16kB	CO62024
2	NTSC/PAL	XL/XE	16kB	CO61598B
3	NTSC/PAL	XE	16kB	C300717
4	NTSC/PAL	XEGS	16kB	C101687

(?) more information or confirmation required

(*) these versions should exist, although I've not seen them.
If you have one (or more?) of these, please contact me.

NOTE:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).

Subject: 13.8) What games support 4 simultaneous players on the 400/800?

The following games support 4 player head-to-head play. Remember, only the 400 and 800 computer models sport 4 controller ports.

Asteroids, Basketball, Breakout, Dandy, M.U.L.E., Maze War, Silicon Warrior, Survivor.

Thanks to mailto:jlodoen@shell.portal.com (Jeff M Lodoen) for initial info.

Subject: 13.9) Why should I disconnect the 810/1050 power supply before connecting or disconnecting SIO cables?

Rich Mier writes:

You've been plugging and unplugging the SIO cable with the 1050 power pack plugged in, right? That's a no-no. Most of the time it's Okay, but about 1 in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right, rear of the main board. A 14 pin DIL chip. Actually it is an array of 5 transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be ON on the CPU. The problem has to do with the secondary winding of the Power Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it 'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

Subject: 13.10) What is Omnimon?

--This section was written by Scott Charles, mailto:scharles@blast.net

Omnimon is a add in board for the Atari 400/800 series of computers and a replacement OS chip for the xl/xe series of computers. The original Omnimon board fit onto the OS board in the 800 series and had a switch attached to it to disable the board. The 400 series required you to bend the circuit board into a right angle for it to fit inside the 400's case. (It was designed to do this.). The Xl/Xe version replaces the OS Rom chip inside the computer with one that contains the Omnimon code, and a revised OS to make the XL more compatible (no translator disks needed).

Omnimon itself is a machine language monitor residing from $C000-$CFFF, with a few variations. It was designed in 1981 by David C. Young (who also wrote Cartcopy, a copier for the right slot of the 800) of CDY Consulting in Texas. The first software revision of Omnimon had a few basic commands and was only 4K long, only for the 400/800. The second revision required the addition of a bank select switch, and was 8K long. Since it was addressed by the 400/800 as 4K, when you needed to use the code in the other bank, all the text on the screen flips upside down, you flip the switch and hit any key. The Xl and Xe versions of Omnimon do their bank selecting through the normal XL port for this function, so it is seamless.

So what can you use Omnimon for? Its main claim to fame is its ability to interupt any running program by pressing and holding the SELECT-OPTION-RESET keys. Depending on the sequence you press determines what kind of warm boot the Atari does. SELECT+RESET does NO warm boot, preserving the stack and flag values of the 6502. OPTION+RESET allows a warm boot (as if you had just pressed RESET) and interupts the vector at $C (initialation vector).

I think you can see where we are going with this - Omnimon was developed as a machine language developer's tool, much in the same way that the Happy modification was developed for legitimate backups. I.E. far more people use both products for software piracy. If you have an Omnimon! in your machine and you try to boot up an Electronic Arts program, for example, you will get a message that says "REMOVE ROM AT $C000", and the program hangs. (Hence,the need for the disable switch on the 400/800 version. There is no way to disable the xl/xe version, just switch it to an alternative OS.) The 400/800 version, since the disable switch just deselects the mapping of Omnimon to $c000 area, can be switched on and off at will.

I myself did not know what Omnimon was used for until I was using a sector editor on a program called Pharaoh's Pyramid, from Master Control Software. On it is a sector that reads, "REMOVE OMNIMON YOU DIRTY PIRATE". This got me to thinking, what does that mean? After about 5 months of playing around with the Omnimon board, I figured out how to use it to pirate software. In fact, it can be used to make most boot disks into binary files, and remove copy protection from countless more.

At the risk of sounding melodramatic, I can safely say that Omnimon hastened the demise of the Atari 8 bit computer by 2-3 years, because of its power.

Subject: 13.11) What is the difference between NTSC and PAL machines?

Software written for NTSC (North America) will always work on PAL machines,
but software designed on PAL machines (Europe) won't necessarily work on
NTSC machines.

Wayne Booth, mailto:trek@ihgp15.ih.att.com writes:

The differences with PAL and NTSC have to do with the number of lines
displayed on the screen and whether they are using 50 or 60 Hertz.

If I remember correctly, I believe PAL has 625 lines/screen and they
refresh the screen 50 times a second doing 1/2 the lines each refresh
so they effectively repaint the screen 25 times a second. NTSC is
525 lines/screen with a 60 times a second refresh - again only half
the lines each refresh so a 30 times a second frame rate. This
would change the amount of time available during vertical sync pulse,
and the number of lines that need to be redrawn each time.

Subject: 13.12) Is the software for the Atari 8-bit computers "TV-standard
dependent?"

{some PAL demos flicker, or won't run at all on NTSC machines}

mailto:buesch@srv.net (Brent Buescher, Jr.) writes:

This is because PAL machines have a vertical refresh frequency of 50hz
(NTSC use 60hz) which translates into more vertical blanking time for
demos and other computation-intensive graphics software. So PAL demos
that won't work on NTSC machines are usually returning from a VBI
(vertical blanking interrupt) too late. Some also attempt to use more
vertical resolution ("longer" display lists) than an NTSC display can
handle.

mailto:thor@math.tu-berlin.de (Thomas Richter) adds:

Yes, it is. Mostly because the frequency of the vertical blank interrupt
is different (60Hz for NTSC, 50Hz for PAL). The old OS A was not clever enough
to notice the difference, so all system timings like the keyboard auto-repeat
function depend on the TV system. These parts of the OS have been corrected
with OSB and the XL versions of the OS. However, as most games install a
VBI, their timing does still depend on the frequency -> they will run
slightly slower for PAL versions.

Another point is that the popular pseudo-colors used in the Antic-F
(Graphics 8) mode are not colorful at all when displayed on a PAL TV, because
of differences in the color encoding for the TV. The schematics of
the Xl computers include however a hack how to change the PAL version to
the NTSC version (the PAL versions include two crystals, one with 5/4th of
the frequency of the other. One is used for the system clock, the other for
the color clock), but I never dared to apply it.

Subject: 13.13) What programming languages are available for the Atari?

Revision : 1.0
Date.... : 4/20/1997

==========
!!!! This section is under construction - HELP WANTED !!!!

The goal is to give information about all available languages
for the Atari 8-bit computer. This information will include;
title, last version, author, date and a short description.
It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Some resources:
- The Multi-lingual Atari, Analog magazine 45, August 1986
- Assembler Interchange Format, Project description
Version 2.2, 2-2-1997, Freddy Offenga

If you like to help or if you've something to add already,
just contact me. There's still a lot work to be done....
Freddy Offenga, email-to: offen300@hio.tem.nhl.nl
==========
There are quite a lot! To get some structure in this section it's
divided into the following catagories;
a) ASSEMBLER
b) BASIC
c) C
d) PASCAL
e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

[D] = available on disk
[C] = available on cartridge

a) ASSEMBLER
- 130XE+ Makro Assembler v2.2, 1992 (Torsten Karwoth) [D]
Two pass 6502 assembler/editor. Supports extra RAM.
Highly compatible with Atmas II.
- Alfasm, Version 1.0, 1990 (Jeff Williams) [D]
Supports 65816 instructions (for the Turbo-816 upgrade
from DataQue Software). This assember is also known as
the Turbo-Assembler/16.
- Atari Assembler/Editor, 1981 (Atari) [C]
Two pass 6502 assembler/editor.
- Atari Macro Assembler, 1981 (Atari) [D]
Two pass 6502 assembler/editor.
- Atmas II Makroassembler, 1985 (Peter Finzel, Hofacker) [D]

Macro assembler with integrated editor and monitor.
- Bibo Assembler, 1986 (Compy-shop) [D]
- Datasm/65 assembler, Version 2.0, 1981 (DataSoft) [D]
Two-pass 6502 assembler.
- EASMD, Version 1.0, 1981 (OSS) [D]
- MAC/65 Macro Assembler, 1982 (OSS) [D/C]
Two pass macro assembler/editor.
- MAE, 1996 [D]
Supports 6502 and 65816 mnemonics.
- Nasm65 assembler, 1992 (Nat!) [D]
Highly portable cross assembler (written in C). Initially
made for the Atari ST. Highly compatible with MAC/65.
- PC-65 Assembler, Version 1.0 beta, 1996 (Jan Feenstra) [D]
Two pass 6502 cross assembler for the PC. The source
format is highly compatible with the ST-65 assembler.
- Synassembler, 1982 (Steve Hales, Synapse Soft) [D]
Two pass 6502 assembler.
- ST-65 Assembler, 1991 (A. Stauffenberg, F.Offenga) [D]
A cross assembler for the Atari ST (written in 68000 asm).
- 6502 Cross-Assembler "xa", 1997 (Andre Fachat) [D]
written in GNU C.

b) BASIC
- Advan BASIC Compiler (Advan Language Designs)
- Atari 800 Basic, Version 1.0, 1981 (Microsoft) [D]
- Atari BASIC, Rev.C, 1983 (Atari) [C]
- Atari Microsoft BASIC II (Atari) [C]
- BASIC A+, Version 3.05, 1981 (OSS) [D]
- BASIC XL (OSS) [C]
- BASIC XE, 1985 (OSS) [C]
- Turbo Basic XL (Frank Ostrowski, Happy Computer) [D]
Interpreter, Version 1.5, 1985
Compiler, Version 1.1, 1985

c) C
- ACE C (John Palevich & Ralph Walden) [D]
This is a newer version of 'Deep Blue C'.
- C/65, Tiny C (OSS)
- C65
- CC65, 1989 (John R. Dunning) [D]
This public domain package includes; compiler, linker,
assembler and object librarian.
- CC8
- Deep Blue C, Version 1.2, 1982 (John Palevich, APX) [D]
Drawn from Ron Cain's public domain C-compiler.
- DVC C, Version 1.01, 1985 (Ralph E. Walden) [D]
- LightSpeed C, Version 1.08, 1986
(Clearstar Softechnology) [D]

d) PASCAL
- Atari Pascal, Version 1.0, 1982 (APX-20102) [D]

- Draper Pascal, Version 1.5, 1983 (Norm Draper) [D]
- Kyan Pascal, 1986 (Kyan Software) [D]
Package includes; compiler, linker and assembler.

e) LISP

Subject: 13.14) What is the Atari XEP80 Interface Module?

This section written by: mailto:raukamp@dame.de (Thomas Raukamp)

Since the development of the Atari 8-bit line of computers in 1979, users wanted better text displays than the default 40x24. There has been some attempts to satisfy this need, like the Austin-Franklin board or the Ace 80/80xl cartridge. For more informations about these modifications read The Atari 8-bit Hardware Upgrade FAQ from David A. Paterson.

The Atari XEP80 Interface Module is Atari's entry to the 80 column field. It lets a XL, XE, 400 or 800 computer system display a full 80 columns across your monitor screen. The XEP80 provides a 256-character wide by 25-line display window. Up to 80 characters are displayed horizontally at once, and you can scroll horizontally all the way to the 256th character, depending on the application you're running. The XEP80 is connected to your system via a joystick port.

The XEP80 Module interprets commands from the computer for screen display or output to a printer. The module is supplied with an industry-standard 8-bit parallel port so you can connect a parallel printer to your Atari 8-bit (I even use a HP LaserJet IV on my 130XE ;)).

All programs that use the standard screen call (E:) should be compatible with the XEP80 Module. The software provided by Atari supports a 320x200 graphics mode - this mode only support direct bit images. Note that you can't use all

of the standard graphic capabilities of the Atari anymore.

Although Atari recommends a monochrome monitor for usage with the XEP80, it runs fine with any type of composite monitor. The output looks great on my Commodore 1084 for example.

Along with the module comes a software-package containing an AUTORUN.SYS file, which is the XEP80 handler. If you want to use the module with an application that is compatible with the XEP80, which has it's own AUTORUN.SYS file, you can append the application's AUTORUN.SYS on the module's AUTORUN.SYS.

Subject: 13.15) What makes some XL/XE software incompatible with the 400/800?

Konrad M.Kokoszkiewicz, mailto:draco@mi.com.pl writes:

XL/XE software won't work on 800 if:

1) it uses shadow RAM at $C000-$CFFF and $D800-$FFFF
2) it uses RAM expansions at $4000-$7FFF controlled by PORTB $D301
3) it uses specific XL OS functions (like JNEWDEVC)
4) it uses illegal XL OS addresses.
5) it uses European Charset :)

Subject: 13.16) What games run only on the 400 and 800 models?

The following are reported as incompatable with models other than the original Atari 400/800. Most probably do work on XL/XE's if you use a translator to run the original 400/800 OS on your XL/XE.

Subject: 13.17) How do I type a tilde (common character in Web URL's) on my Atari?

The Shadow, mailto:The_Shadow@spnt.com writes:

The question is: "How do I type the tilde or squigly line which is in most web addresses? I don't have a key for it..."

Answer: The tilde is an inverse backspace on the Atari 8-Bit which can be very hard to type depending on the term program you are using, however you can insert the hex equivalent very easily, which is %7e in place of the tilde and it will work just perfectly. Do not put a space either before or after the %7e.

I (Michael) add:

Some advanced Atari software supports the tilde character natively. E.g., you can type a tilde in Ice-T with the Atari Logo/Inverse Video key.

Subject: 14.1) What vendors, developers, or publishers support the 8-bit Atari?

See the "Atari 8-Bit Computers Vendors and Developers List." Available via:

http://www.faqs.org/faqs/atari-8-bit/vendev/

and Usenet FAQ archives everywhere.

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

---

Subject: 14.2) Where is my nearest 8-bit Atari BBS?

Trevor Holyoak, mailto:trevor@holyoak.com maintains the "Atari BBS List."

If you'd like a text-only copy, simply send e-mail to
mailto:kendrick@zippy.sonoma.edu with the subject:

send emulator faq

Subject: 14.6) What hardware upgrades, modifications and add-ons are available?

The Atari 8-bit Hardware Upgrade, Modification and Add-On FAQ is maintained by
David A. Paterson, mailto:davepat@total.net or see:

http://www.geocities.com/SunsetStrip/Alley/1878/hard_faq.htm

Subject: 14.7) What is the HARD-Interlacing-Picture (HIP) format?

HIP is a new method to displaing pictures on small atari...

HIP stands for HARD-Interlacing-Picture and was found by
Members of HARD Software, Hungary in June, July 1996...

It enables to display 160 x 240 Pixels with 30 shades without
nearly all flickering (depends on the source-picture you use)...
HARD stands not for HARD or HEAVY Interlacing, just for the
inventors...

For more information, see the HIP-FAQ, located at:
http://www.uni-karlsruhe.de/~Marek.Tomczyk/Atari8/hipfaq.html

or contact HeAvEn at mailto:nadkar@fh-pforzheim.de

Subject: 14.8) How do I access Usenet, FTP, Gopher, and WWW by e-mail?

The Accessing the Internet by E-Mail FAQ is maintained by "Doctor Bob" Rankin,
mailto:BobRankin@MHV.net or see:

http://www.faqs.org/faqs/internet-services/access-via-email/

Actually, there are TWO groups on Long Island. Ol' Hackers meets in the Plainview-Old Bethpage Library third Saturdays and is exclusively 8-bit. LIAUG meets at the Nesconsett branch of the Smithtown Library first Saturdays and supports all Atari products.

So, if you're on Long Island, you can take your pick!

Hi Kenneth,

If you have a bootable disk with DOS already on it then go to my website at www.atari.nu, go to Atari Computers, 8-Bit Systems, Atari 400/800 and go to the Atari 850 section, there you will find the driver listing. Its a simple BASIC language program, type it in and run it and it will modify your DOS so that each time you boot up it will download the code from the ROM chip inside of the PR: Connection into your Atari so that it can communicate with the PR: connection. Take care...

The Atari 800 emu by David Firth never worked for me. I dont know why,
but I must have been doing somerthing wrong. I like XLIT.. it was the
easiest to use (for me anyway)

And Xformer isn't bad.. actually Xformer and Xlit together run about 95%
of all 8bit software. to date the only thing not emulator is 4 player
games (like 4 player mode of MULE/Asteroids) and Digitzed sound effects
(like Samples from the ASP (Antic Sample Processor)

But do you need the screen on during file transfers? Currently, I get speeds of 1100 cps using a 19,200 modem connecting to a 19,200 8bit BBS PRO board. I was told that is the best you are going to get.

But with the same modem, hooked up to the dial up server at U of T, I can get 1500cps (or higher!)

I was wondering if anyone here has done (or knows how to do) the software decompressing that you see in a lot of European games. (I am not talking about ARC or ZIP) I am talking about those 50-60k executables files, that when you load, they say "Decompressing..." and the screen flashes to keep you entertained... I have never seen any North American software product do that, and I was wondering how the European 8bitters do it?

I think some of the Demos from the Netherlands used something like that for the BIG DEMO (and other 8bit Atari demos)

I heard from a friend there was a MOD player released for the 8bit.. used
the Ramdisk to hold samples.. (some of them can get big!) But I find it
difficult to believe you casn get crystal clear samples on the 8bit.

I did some sampling on my PC, to record Cd quality 44khz sound for like 10
seconds takes nearly a meg of RAM. Perhap WAV is a space waster file
format.. i dont know.. but It would be very cool if it could be done.

Who knows, maybe somebody has written a high quality sample program for
the 8bit..

My brother is in the auto motive business and we were looking for some
software to keep track of his customers and his work. He saw some
softwarwe packages at car shows.. problem was the price.

Ridiculous aty $5,000 US dollars!!

But on a positive note I do remember some Atari 8bit car software
advertised in either Antic or analog.. beats the hell out of me what issue
it was and I have about 40 issues! (maybe you can search througu Antic
articles online???)

Or even check auto magazines.. because I saw anotgher software package is
a Mopar Muscle car magazine.. problem is these soiftware packages are
horrendously expensive...

One of the best sites I found, even though it is slow, is:

ftp://yoshi.meil.pw.edu.pl/atari8bit/Games-files/t/

I found games there that I thought were not transferred to *.ATR, yet.

I last accessed this site a year ago. Is it still there?

Ron

112. JTS Corp. Share Price

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-05 00:00:00 UTC
From: Robert Pagano <rpagano@NOSPAM.ibm.net>
Message-ID: <34b1afdf.0@news1.ibm.net>
Source record: 67471

For those who care....

JTS Corp. shares closed at $0.25 on 5-jan-98.

Let's see... They have ~157 million shares outstanding so if we can scrape up $39.25 million (actually, we would only need 51% of that... say $20 million), we could own JTS. Then we could have the pleasure of canning the Tramiel family.

It was last March I guess. Probably quite popular due to the retro craze. I
think they advertise in CVG.

Using an ATI All-in-Wonder card, I can hook my 800xl up to my nice
15" Vivitron. That way I can use both machines, and it doesn't
take up a lot of space.

CD quality is 16 bit sound. 44K * 2 bytes * 10 seconds == about 880K for
just one channel.

This is correct,
but it works only well if you have not access to the same time.
If both computers makes a access to the connected floppy for writing for expample, the probability to write trash is very high.
So if you work for example with programms witch automatic loads the next screen, it is a horror.

Hi !

I am looking for the text-adventure Amnesia by Cognetics
Corporation/Electronic Arts.
If you want to sell your game, please let me know. (I am looking for the
original version with box, etc.)

I am also looking for a lot of other old adventures (text-only or text with
graphic) - so if you have some for sale, just send me your sales list,
please.

Don't forget that communications with a speedy/happy/etc enhanced drive
goes way beyond the 19k2 'limit' without turning off VBI's or even the whole
ANTIC. IIRC Happy drive's operate at ca. 56k and speedy drives even at
70k. For the speedy drives there also existed a program that could copy
disks at 96k but then it would turn of the screen.

I have heard of commercially available 8-bit DAC's. I once built one myself
(eight resistors and a capacitor (sp?)) which connected to two joystick
ports. Not very useful for games (no joystick port available), but it worked.

>I heard from a friend there was a MOD player released for the 8bit.. used
>the Ramdisk to hold samples.. (some of them can get big!) But I find it
>difficult to believe you casn get crystal clear samples on the 8bit.

There are some different MOD-players for the atari 8-bit. Most of them
use converted MOD-files (MD8-files) but IMHO it's a pain in the butt
to convert every single MOD-file you want to play before you can actually
_play_it. That's why I wrote a player that loaded MOD files directly and
converted them to an internal format on the fly. My player also gave a
better sound quality (5.1kHz 5.5 bits mono) than the first one (from poland).
Some german guy (forgot his name) improved on that (something like 6.5kHz 6
bits mono) but reverted to MD8 files again.

URL: http://pmwww.cs.vu.nl/home/ipoorten/Atari.8bit.Homepage/software.html

Don't have any other URL's at hand...

>I did some sampling on my PC, to record Cd quality 44khz sound for like 10
>seconds takes nearly a meg of RAM. Perhap WAV is a space waster file
>format.. i dont know.. but It would be very cool if it could be done.

WAV files are almost raw. 44.1k x 2 (bytes) x 2 (channels => stereo) x 10
equals 1764000 bytes, which is for about 1.7 megabytes.
The samples contained in a MOD file are 8 bits mono at a rate of (IIRC)
11 kHz. Those take a lot less space. (BTW on an atari 8-bit they are
converted to 4 bit samples).

>Who knows, maybe somebody has written a high quality sample program for
>the 8bit..

Well, it's been a while but I posted my Iron Man Lyrics Teacher program here once. I put an atari 8bit gallery of original art I did as a kid on the WWW.

It's basically just for kicks and nostalgia for me though. I'd like to see a TCP/IP stack with IRC client or whatever.

Then you need to join the AR mail list!

i'm not sure of all the instructions, but, send an email to:

arlist@oasis.slcc.edu

with 'subscribe' in either the subject/body or both (can't quite
remember) but if you sent the email, someone will contact you w/ the
specific instructions.

Also, there is an #alternate-reality chat channel on Efnet (if you do any
irc'ing)

Re: multitasking/multithreading/virtual memory...

Multitasking is one thing. Tom hunt did it with MTOS for
expanded xl/xe systems. But multithreading is another animal
entirely! Instead of virtual machines, like what Tom did,
It is more a setup like the Amiga, with virtual terminals,
and programs passing information back and forth through pipes.
This is truly amazing! Once again I say, how is it that the
C64 merits _THAT_ and the Atari8 does not? =)

Or is your multithreading more like what happens on the BeBox?
In that tasks are broken up dynamically for best operation?
That would take a work of _GENIUS_...

I want to buy SAM. I figure I need to get an International
Money order. I live in Ohio. I wonder how you go about doing it.
Do you just go to the bank and ask for one in Pounds or Marks,
or whatever it is you want to exchange to? Unless they can
take American dollars, which I would think would be a pain for
people in Europe or the UK to deal with. I could probably send
Canadian dollars, which would just be as bad to deal with...

A couple of packers are available for our systems. They are like
Squish on the ST in that they create compressed executables.
The one I like is File Packer 2. It checks to see if the file
can be compressed first. It is also like PowerPacker as is on
the Amiga, by Nico Francois, I think.

141. PC Xformer : What worked for me

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-06 00:00:00 UTC
From: jrgent@hhs.netnospam
Message-ID: <34b1881d.124405@news.hhs.net>
Source record: 67478

I built the Xformer cable and after following the instuctions that
were included with version 3.60, the thing wouldn't work. After
playing with the instuctions on the command line for awhile I was able
to get it working. This is how:

First, leave the drive selection switch on the 8 bit drive set to be
D1: Turn it on.

Run Xformer with the command line: xformer -x

If everthing is right the program should calibrate the cable and the
blue intermediate screen should appear. Look for the calibration
value on this screen and write it down. Exit the program

Turn off your 8-bit drive and set the drive selection switches to
identify the drive as D2:

Run Xformer again with the command line>

xformer -x:nnn newdisk.xfd D2:

< nnn being the calibration value and newdisk.xfd being your

copied dos file.

You should then be able to use the dos menu to access the 8-bit
drive as D2:

> Great condition, complete & ready to run.$25 + shipping

Actually, the XE Game Machine is a re-packaged 65XE, not a 130XE. The
important difference is in the amount of RAM on board (only 64K, while
the 130XE had 128K).

BTW, that's a good price if you are including the power supply.

I bet you're stuck when you get to level 7(the last level.) That's a hard level. The trick is to grab an extra gem from level 4. You will be able to take it with you. Then, when you get to level 7, you will only have to kill 2 of the gem creatures to get the gem, (instead of 3).

Also, if you are using Xl-it, you can use the editor to change the number of men, swords, etc, that you have. The following memory locations contain the number of men, swords, etc.

034b number of men(don't go above f, use 9)
034d tens digit of number of swords
034e single digits of number of swords
034f to 034g I think theses handle the gems, keys, etc.

Source record: 67405

Okay, So I have the infamous Computereyes. I have had some great success with it so far, but I want to be able to print these Gr. 9 pics!

I have tried some public domain stuff, one called KWIKDUMP - did four colors really small with lots of lins.

The rest just couldn't even display them (well, they werent very recognizable)

Anyway, the 16 colors look fantastic, whats a good dump program? I have Printwiz for ?microallen? but I really don't know how to use it.

Thanks for your help!
Ascii

Oh yeah, I have a Okidata 180. Im pretty sure its 100% epson compatible

Assuming they're willing to sell it... At this point, I don't think
that'd be a problem. Still, they might be willing to sell the Atari
properties for quite a bit less, but then again, is the rest of JTS
really worth anything?

Virtual teminal has nothing to do with multithreading.
Multithreading is to have several execution paths within one
process, i.e. sharing variables, memory, file descriptors.
With Multitasking the different processes have separate file
descriptors, probably different memory mapping etc.

Virtual terminals are an I/O question and pipes are an issue
of interprocess communication (IPC).

My selfbuilt OS has multtasking, multithreading, virtual terminals
(kind of - you can switch between several screens with different
programs running) and of course pipes.

: Or is your multithreading more like what happens on the BeBox?
: In that tasks are broken up dynamically for best operation?
: That would take a work of _GENIUS_...

In fact I am now thinking of using threads to start kind of
cgi-bins from the web server, as the execution of another task could block
but the web server/slip interface should still serve other tasks.

And again: this OS not only runs on the C64 but on two different
selfbuilt 6502, and an Apple II port is on the way.

Andre

Hmm. Good idea. Never thought about using SynFile. I have every version
of that program, but have never used it.

Have anyone successfully used Synfile or Synfile+ for this type of
tracking application? It may be worth trying..

Are you saying you can use a Sysquest Megafile 44 with an 8bit? I have one (sitting in the closet on top of a 520 ST :)) what do I need to do to get it running with my 800xl?

I would love to know that number as well. I think that the numbers you posit are too optimistic; my (admittedly wild) guess would be in the 100,000 range (at most).

Any thoughts/ideas on how to get a reasonably accurate estimate? Any "Statistics" majors out there?

Source record: 67424

When was the last one published?

I was going through my Antic collection.. I am missing all of 1982.. most of '83.. I have most of 85, 86, 87... I am missing some of 88 and 89.

It would be nice to complete my collection. I would be willing to buy/trade for Antic magazines. Please send me the issues (month/yr) in e-mail. I have many Atari 8bit books worth trading, COMPUTE magazines (tonnes of them!), some 8bit original software (like the Diamond OS demo disk from Alan Reeve software w/ manual)

Also have some 8bit ROMs that I can trade with. I would rather trade or sell than buy because it costs more than $1.45 Canadian to buy a U.S. dollar nowadays!

Canadian money might as well be Monopoly money the way things are going!

So if the technology can be hacked up to support those speeds for floppy drives (which operate through the SIO port) why not a Black Box pushing 19,200 BPS?

I don't think the Atari 8bit screen handler s: can handle those speeds.. but for file transfers who knows..

I know you're joking here, but I've never understood the Atari/CBM rivalry.

If you look at every 8-bit computer every made the Atari 800/C=64 are the closest related machines of all time. Each computer had advantages/disadvantages over the other, but these machines have so much in common that a rivalry is just plain counter-productive.

If comp.sys.atari.8bit and comp.sys.cbm were working together, the Atari would be running SLIP code right now. The same code runs on both machines with only minor modifications.

The c64 user base is huge and Atarians can't afford ignore it.

Could you see an Atari with twin SID chips for stereo sound?

An ANTIC/POKEY cartridge for C64?

Remember the Apple II, uppercase-only characters and a speaker that went beep?
Or the original IBM PC? CP/M?

Both Atari and CBM were years ahead of these guys
with products that cost less than half the price.

The 800xl and c64 are closely related brothers, no other computers from the 8-bit era were so powerful or innovative, except maybe the COCO 3 because of the 6809 CPU and OS9.

I love and use both machines.

Can't we all just get along?

N.V.

Ascii,
I personally like BASIC XL and BASIC XE. The String manipulation features are tremendous. TBXL is very similar, but not as full featured. BXL/BXE are cart based. Both have extensions to add features. Both are available at www.myatari.com (B&C Computervisions).
I actually wrote a very complex Family History database program that could search forward and backward in time, supported pictures and text files and could span multiple floppies w/o losing its place. I also wrote a companion program to Jeff Potter's Colorview that printed 4096 color CV pictures on a Star NX2420 Rainboe dot matrix printer. Both programs were 100% BASIC XL or BASIC XE. (Lifelines was BXE) (CDump103 was BXL).

: of their time. Atari wanted the first computers for the home to be something
: that wasn't expected to be programmed, but ready to use with programs already
: written. Kind of like things are today.

I can only suspiciously frown at such a contention. My guess is it was more a question of economics (keeping the price of the machine down by not licensing a BASIC for shipment in all systems) than it was some "forward-thinking" on Atari's part. Note that I don't think that BASIC is necessarily the best way to boot up a computer, but I don't think they stood apart from their generation because of any great vision. (Would you also contend that they were ahead of their time in advocating that a piece of equipment costing hundreds of dollars be used as a notepad?)

>PLEASE! I'M NOT TRYING TO START A FLAME WAR!

Flame war, advocacy, arguing the equivalence of one's computer could be construed as arguing its superiority. Flames WILL ensue, believe me.

A more useful dialogue would result from proposals of cooperation on certain fronts that one community has tackled, but another has yet to fully explore.

For example, the Atari and Commodore 64 both communicate to their disk drives using a type of serial bus. Steve Tucker's program "APE" has allowed a PC to emulate all the features of practically every known Atari I/O peripheral by the means of a simple cable with one chip in it. While there are utilities designed to connect a PC to Commodore disk drives for the purpose of copying files, there isn't much out there to reliably connect an actual Commodore 64 to a PC for the purpose of serving files. Commodore users cite fast loaders as their main obstacle. APE, however, not only emulates several variations of fastloading, but it supports better, faster access routines that have ever been possible with a real disk drives. Commodore users should be interested in how this was accomplished, and whether the methods Tucker used would apply to tackling the mystery that is the 1541.

That's one place to start. I'm sure you all can think of other things.

Remember all... MIPS means millions of instructions per second. A MIPS rating does not track how much processing an instruction does or how complex it is. Intel chips are CISC, while the 65xxx series chips are RISC. Though many CISC instructions MAY take more than 1 machine cycle, they often do the work of many RISC instructions. There is some food for thought too.

Ken, Mac/65 was released in a disk based version as well. In fact, I believe OSS released it on diskette before they put it on cartridge. If the guy was trying to run some kind of cart image then your comments are perhaps insightful. If he is trying to run a disk version then it must be something else. I tend to believe it is a disk version he was trying because he mentioned DOS XL which Mac/65 disk version was distributed with.

Turbo Basic generally runs fine with anything that doesn't usethe RAm
under the OS ROMs. Sparta (except old 1.x and X configured not to)
uses that area and so is not compatible. Too bad the best basic and
the best dos aren't more compatible.

I guess I got so used to SpartaDos I left all the other doses (like SMART DOS, or TOP DOS, or even MyDos..) out of the bunch MyDos probably is the best on in terms of compatibility...

I dont remember testing it with MyDos, but it probably should work. I consider MyDos a Dos 2.5 derivative with some extra drive support, sub-directories, and hard drive support.

(oh yeah I think MyDos supported time and date stamping but I'm not sure.)
I guess I was destined to loved command line processing.

(look at me now.. it's not UNIX (or a derivative of Unix) its crap! YOu can tell a real programmer at school. If you are forced to used Windows 95, the real programmers ALWAYS drop to MS-DOS to do file operations.. none of this File Mangler (or whatever they call it now!) heh heh

One thing about that C64.. it did have some really neat games that were never really ported to the 8bit. (or at least I never got to see)

GUNSHIP
Maniac Mansion (ah man I used to waste my whole lunch hour playing that silly game in grade 4)

And some of the role playing games, (Apart from Alternate Reality, the 8bit RPGs were on the weak side..) Granted Phantasie was good, but it played SO SLOOOOOOW.

I think the old reminiscing is good for the soul. Let's us reflect where we were, and where we are now...

And the C64 had much more software support (in the later years, late 80s) As Atarians we all know what happens to Atari software in the late 80s..)

It disappeared!

Anyone out there have this game? I have a bunch of games to trade.

There was a revision of the game that fixed a defect: The early versions didn't accelerate the guy's running or increase his jumping distance at the highest levels, hence the game was impossible to finish.

The cheat to get to the highest level was to type in the phone number of the software company, and then press the number of the level you wanted to go to. In this way, you could determine if you had the fixed version. But I'll take any version.

Thanks.

I just stumbled across this newsgroup and thought you all might be interested in a modern-day use of the Atari 8-bit.

As a major Atari 8-bit user and proponent since junior high, I spotted the trademark character set and fine scrolling of an 800 in the halls of Andersen Consulting's worldwide training center in St. Charles, IL. Each hallway has a monitor telling people where to go for their classes, and these schedules are all displayed by an Atari!

I left Andersen in '94, but they were still using the Atari the last time I was out there.

And you thought AC only used COBOL!

198. C64 hard disk support

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-08 00:00:00 UTC
From: Alan Christie <94chrisv@scar.utoronto.ca>
Message-ID: <Pine.GSO.3.95.980108174834.17043J-100000@fissure.scar.utoronto.ca>
Source record: 67299

Just out of curiousity, what was the C64 hard disk support like. Anyone knowledgable can throw out the C64 hard disk support history? Atari 8bits appeared to have HD support with the DINOSAUR ATR-8000 way back in the good old days as well as the Corvus hard disk. the MIO and Black BOx I feel revolutionized HDs on the 8bit.

Is there a device that allows a C64 to access over 100 megs of hard drive space (using MFM/RLL and EVEN SCSI or IDE hard disks?)

Someone mentioned C64s have ramdisk support? The 8bit had it with the Axlon way way back.. and what is the ramdisk size limit on the c64?

I think the EXPANDABILITY of the machine and how its being used now speak louder than original design features. While original design is important, all the add-on make the system what it is. I have always said if you are using an 8bit with a BlackBox/hard Disk/Ram Disk system you are using a crippled Atari...

And speed! How fast is the fastest C64 floppy? fastest C64 Hard disk?

And of course this is a heavily ATari 8bit biased newsgroup. I don't think the C64 can have their experts offering opinion if this post isn't read by all 8bit users.

Source record: 67304

In the mid 80's I constructed a device that allowed to 800's to share
the I/O devices. Because the data cable supported a busy line, I was
able to isolate the 800 that was not busy. The chip switched the t/r
lines.

It worked reliably and predictably. The second 800 would either retry
until the I/O was avaialable or time out. I didn't find any software
that couldn't recover and retry after the timeout.

With this device I was able to leave my 800's connected and use the
Printer, Disks and Serial Interface. I probably have it in a box
somewhere.

Mac/65 is a back switching cartridge AFAIK which means if
you have an 8-bit you must have the actual ROM to run it.
A disk image won't do.

Just stabbing in the dark here:

The problem may be that the emulators he tried don't

Did commodore make an 8-bit I know nothing about? They don't
have squat in common. Well, other than the fact that C64s make
really good, ummm, er, ahhh, matter of fact, now that I think
about it C64s really aren't good for anything.

>If comp.sys.atari.8bit and comp.sys.cbm were working together, the Atari would
>be running SLIP code right now. The same code runs on both machines with only
>minor modifications.

What planet are you coding on? Unless you're writing beginner's
assembly loops to count from 1 to 10 the code on the computers is
vastly different because graphics, sound, IO, memory locations,
expansion devices, etc. are entirely different.

>The c64 user base is huge and Atarians can't afford ignore it.

Why not? Their software doesn't run on the Atari. Except for
joysticks and monitors their peripherals don't work with the Atari.
It's not 1984 anymore; there won't be a huge 8-bit revival; this
is all just the playthings of a few hobbyists. So, who really cares
what they're doing with the C64?

>Could you see an Atari with twin SID chips for stereo sound?

Yes, I'm certainly dying to have lame, tinny sound on my Atari.
BTW, a similar hack exists to put two POKEYs into an Atari.

>An ANTIC/POKEY cartridge for C64?

Practically impossible. CPU/Video/RAM work substantially
differently on the C64. To get ANTIC to work on the C64 you
would basically have to replace everything and then all you

would have is a very clunky Atari 8-bit.

>Remember the Apple II, uppercase-only characters and a speaker that went beep?
>Or the original IBM PC? CP/M?

>Both Atari and CBM were years ahead of these guys
>with products that cost less than half the price.

Until nearly the end, the Atari 8-bit hardware and peripherals
were usually more expensive than the Commodore 64 stuff (you do
get what you pay for). Also, before the motivation to cut prices
came (the C64 appeared) Atari hardware was very expensive.
Anyone remember those $500 SS/SD 810 floppy drives?

Commodore only lead the pack in making cheap, functionally-
impaired hardware for the lowest cost. They were good at
exploiting consumer ignorance, not making powerful computers.

>The 800xl and c64 are closely related brothers, no other computers from
>the 8-bit era were so powerful or innovative, except maybe the COCO 3
>because of the 6809 CPU and OS9.

The word powerful and innovative in the same thought with the C64.
It boggles the mind. The Atari 800 came out some four years before
the C64. The C64 had fewer graphics modes, fewer sound voices,
a slower processor, and zero OS support for the graphics and sound
that it did have. Some huge advance for 4 years of Commodork R&D.
The only thing really different about the C64 was a dirt cheap price
tag. Oh, and horrendous reliability problems. All my friends always
had a computer or a floppy drive being fixed. Did someone say you get
what you pay for earlier?

>I love and use both machines.

May I call you Sybil?

>Can't we all just get along?

No. Who took my pile of bricks?

</silly sarcasm mode off>

Golly, but that was fun.

It sounds like your running MAC65 with the Atari BASIC enabled (to
confirm this type "CAR" from DOS XL). Disable BASIC and MAC65 should
work as expected.

(Actually, if you're desperate enough to limit yourself to
two players [plus the four missiles] per scan line you can
set the priority of players so that two overlapping players
make four colors; transparent, top player pixel, bottom player
pixel, and another color where both players have overlapping
pixels [I think EOR'd from the players' colors]

well, in all honesty, the Atari 8-bit keyboard layout is pretty
lame, too. There are no { } characters which make C coding
really tough. ATASCII is not ASCII and that $9B instead of $0d
or $oa for end of line bugs me.

[snippity]

>>If comp.sys.atari.8bit and comp.sys.cbm were working together, the Atari would

[snip]

Shame on you, this is the 90s. Get with the politically-
correct, relativistic standards of the age. Everyone's
computer is equal. Otherwise people who bought inferior
junk might start believing they were stupid. Then they
would have low self-esteem and it would all be your fault,
so you would have to be forced to attend computing sensitivity
and diversity training. :-)

[snippity]

>>Both Atari and CBM were years ahead of these guys
>>with products that cost less than half the price.

<... and the crowd applauds...>

[snip]

>>Can't we all just get along?

>Sure, but not if I have to call the most ahead-of-its-time micro equal
>to an inferior product designed years later.

Tsk, tsk, tsk. That wasn't very nice. Now give him a
nice, big, wet smooch and tell him his computer was always
as good as yours. Your computing diversity training begins
tomorrow at 9AM sharp. The sensitivity instructors will
pick you up. You'll recognize them by their brown shirts,
armbands, knee-high boots, and riding crops.

heh heh heh

210. 4th Northern SAM & Spectrum Show - incorporating 8 Bit Show

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-08 00:00:00 UTC
From: David-Editor of Blitz Fanzine! <david@persona.clara.net>
Message-ID: <34B4A544.6E64@persona.clara.net>
Source record: 67346
Cross-posted to: comp.sys.amstrad.8bit,comp.sys.atari.8bit,comp.sys.cbm,comp.sys.msx,comp.sys.oric

Hello all,

Just a quick posting of an event you may be interested in....

The Fourth Northern SAM & Spectrum Show - Incorporating 8-Bit Show

The first NSSS shows have been so popular that we've decided to
throw the doors open to all 8-bit owners this time!

Whether you be an ordiary user, or any sort of support service
(magazine, software publisher, hardware creator, etc) then we'd love to
see you there. And this time, due to the success of the earlier shows,
we've managed to reduce stall costs for anyone wishing to book one!

The show is held at Wetherby, Near Leeds - within easy transport of
National Express coach, local buses etc. If you're unsure of where to
go, sending an SSAE will give you directions.

At previous shows, we've had all the top names on the SAM & Spectrym
scene; Fountain PD Library, Crashed, Impact, Quazar, Alchemist Research,
Persona, Format, Fred, Sintech, Blitz Magazine, Flexibase, SD Software
and more .... and they've all been invited for this time around too.

So don't miss out! Be there on the 28th February 1998.

For more details, call George on: 01937 583827 (after 6pm), fax 0161 476
3377 or send an SSAE to: NSSS, 32 Barleyfields Road, Wetherby, West
Yorkshire, LS22 6PW.

More information can be found on....

211. Re: Antic Atari magazines

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-08 00:00:00 UTC
From: cb541@cleveland.Freenet.Edu
Message-ID: <691g0f$7og$1@alexander.INS.CWRU.Edu>
Source record: 67347

(A favorite subject of mine. Following something I prepared
a while back)
A little history:
ANALOG published their first issue 1-2/81 (#1) and their
last issue was 12/89 (#79). They were supposed to be
bi-monthly at first (it took 32 months to publish the first
12 issues), then they went monthly pretty regularly until
10/87 (#58), when there was a six month gap, until 4/88
(#59) when LFP bought them.
Antic started 4/82 (Vol. 1 No. 1) and was bi-monthly for
the first year, until Vol. 2 No. 1 (4/83), when they went
monthly. Antic published monthly pretty regularly until 9/89
and went bi-monthly from 10-11/89 to 6-7/90 (Vol. 9 #2, last
issue of separate Antic.) Antic was then put as a
department in STart for four months and then STart published
their last two combined ST and 8-bit magazines 2-3/91 and
4-5/91, which was the last issue of both Antic and STart.
There were about 94 Antics, including the Antic section of
STarts.

Source record: 67348

(revised ANALOG paragraph)
A little history:
ANALOG published their first issue 1-2/81 (#1) and their last issue was 12/89 (#79). They were supposed to be bi-monthly at first, but were more like tri-monthly, taking 3 years to publish the first 14 issues. The months were not put on the cover of most of the first 14 issues. Then, beginning 1/84 (issue #15), they went monthly for 45 months until 10/87 (#58). There were 43 issues during that 45 month period. Then, from 10/87 to 3/88 there was a six month gap. LFP bought them and published monthly for twenty issues beginning 4/88 (#59) until the last issue #79 12/89. ANALOG then 'sold' or 'gave' their subscribers to Antic for an 'equivalent' number of remaining magazines. I'd like to know who now owns the rights to ANALOG.

Antic started 4/82 (Vol. 1 No. 1) and was bi-monthly for the first year, until Vol. 2 No. 1 (4/83), when they went monthly. Antic published monthly pretty regularly until 9/89 and went bi-monthly from 10-11/89 to 6-7/90 (Vol. 9 #2, last issue of separate Antic.) Antic was then put as a department in STart for four months and then STart published their last two combined ST and 8-bit magazines 2-3/91 and 4-5/91, which was the last issue of both Antic and STart. There were about 94 Antics, including the Antic section of STarts.

Bryan Edewaard (bryede@emi.net) wrote:
:
: Actually, Atari owners do have a reason to dislike the 64. The 64 is
: inferior in just about every way.

<snort>

: >If you look at every 8-bit computer every made the Atari 800/C=64 are the closest
: >related machines of all time. Each computer had advantages/disadvantages over the
: >other, but these machines have so much in common that a rivalry is just plain
: >counter-productive.

I disagree with this contention, BTW. The 64's total lack of reliance on
an externally booted OS before the user gets real control of the machine
sets it apart in its generation. (Yes, this can be a disadvantage for
-some- things. But it makes it a hell of a lot easier to get started.)

: Atari: Many graphics and text modes assignable on a scan-line basis.
:
: Commodore: Few modes, each full-screen.

This is a bit of an oversimplification. The 64 has a pretty wide variety
of graphical modes that have been "discovered" over time, and you most
certainly can switch between them on a single screen.

: Atari: up to 5 players (sprites) per scan line. Single color.
:
: Commodore: Up to 8 sprites, multi-color.

8 sprites per scan line, you mean.

: Anyway, I don't think that superior sprites made up for the fact that
: the 64 was harder to use:
: 1. couldn't auto-boot disk software

No big deal, you learn pretty quick that LOAD"*",8,1 gets you started with
90% of all commercial software. I think that's a reasonable tradeoff for
never ever having to worry about a DOS disk.

: 2. couldn't display upper and lower case text simultaneously

This is an outright lie.

: 3. no DOS utilities provided with the 1541

I'll give you the benefit of the doubt on this one, presuming you either
never got a full 1541 package or one that somehow predated the standard
"test disk" included with every one I've ever seen. But you're still

wrong.

: 4. unusual keyboard layout

The Atari's layout is a little weird, too. Hardly a "difference" in this department.

: had fewer hardware features, and was more difficult to program for.

This is a generalization, which leads me to believe that you actually have no idea what the "hardware features" of the 64 are, nor how to program for them.

: But it was cheap. In a day when no one really understood what they
: were buying, they flew off the shelves.

People knew exactly what they were buying--a cheap, good computer for which there was tremendous support.

Actually, it's a 64k machine like the 65XE rather than the 128k 130XE.
Still, you can get more than that for it. I suggest eBay.

And, by the way, complete should include the pack-ins (FS2 and Barnyard
Blasters) and the Light Gun... I've seen the gun alone go over $20 on
eBay.

All,
When I first got into Personal Computers there only a few choices. At the time, the Atari 800 and the C64 were the best choices (1982). I had the opportunity to play with these systems days on end for free. I was selling these puppies. As you can see, I chose the Atari. It was, at least for me, the easiest to program and did so much more than any of the others. The only thing that bothered me was the price. In those days, prices were a bit prohibitive. Even to this day I have access to both systems and still lean heavily toward the Atari. I have a couple of 130XEs.
BTW, On the C64, how do you LIST a BASIC program to disk or to a printer? Hoe do you ENTER text based BASIC code into the C64 BASIC? Is there a simple way to convert PETASCII to real ACSII (or ATASCII)? Even though the Atari 8-bit uses odd EOL and back space characters it is easy to compensate for. PETASCII files are a real female dog to convert. My father has a bunch of stuff done in a Timeworks word processor (straight text no formatting) that he wants to have converted to ASCII so that it can be imported to Winword. I guess I should drop by C.S.CBM and ask there.
I'll stay with my Atari 8-bit for my fun and my PC for the work stuff (and "WORK" is the operative word here).
I like the ideas this NG is coming up with. Maybe there is a future here after all.

Forcing the user to type something to get going is easier than
autobooting software? Easier for who? Lazy programmers? Certainly
not the user.

It requires assembly code to service an interrupt which makes
it impossible for a BASIC programmer. On the Atari you only
have to change some bytes in the display list. There is also
support built into the OS for a text window on most graphics
modes. The Atari doesn't resort to ML interrupts until you
want to put extra color on the screen, cut up players/missiles,
use multiple character sets, etc.

>90% of all commercial software. I think that's a reasonable tradeoff for
>never ever having to worry about a DOS disk.

I don't think it's reasonable. After four years of R&D Commodore
discovers a deficient and more user-hostile interface.

It's that other 10% of the software that makes life with
a C64 irritating.

>: 2. couldn't display upper and lower case text simultaneously

>This is an outright lie.

Maybe he means graphics characters and lower case?

>: 3. no DOS utilities provided with the 1541

>I'll give you the benefit of the doubt on this one, presuming you either
>never got a full 1541 package or one that somehow predated the standard
>"test disk" included with every one I've ever seen. But you're still
>wrong.

As I recall most of my friends had to type arcane things
to do things like rename files, etc.; until one of them
bought one of those quick load cartridges. In the end,
to make their C64s behave more like Ataris most people
ended up buying enough extras to make the C64 cost more.

>: had fewer hardware features, and was more difficult to program for.

>This is a generalization, which leads me to believe that you actually have
>no idea what the "hardware features" of the 64 are, nor how to program for
>them.

He was summarizing... fewer graphics modes, fewer colors, fewer sound
channels; those are the fewer "hardware features" he references. You
think maybe these things happen by magic? I would have also added
"fewer software features." A minimalistic kernal with no support
for the hardware.

>: But it was cheap. In a day when no one really understood what they
>: were buying, they flew off the shelves.

>People knew exactly what they were buying--a cheap, good computer for
>which there was tremendous support.

Most of my friends who ended up with a C64 didn't really want
it. Their parents bought it, because it was cheap and they
had no other clue about computers.

When the C64 came out there was virtually no support for it
compared to the developer base built up for the Atari 8-bit
over the previous years. The "tremendous support" only
developed *after* a lot of people were bamboozled into buying
a cheap computer.

My, my, my! Machine Wars among adults? Takes me back a few years.

While there may be only very limited direct hardware, programming, user-interface, pricing, etc. similarities between Atari 8-bits and C-64s, I think the fact that the Commodores can do things that Atari 8-bits are not doing at present should serve as an incentive to try harder. Note that I'm not a programmer or hardware hacker by any means, just a gatherer and disseminator of news and some history.

But, doggone it, both communities have lasted longer than they were "supposed to." Who knows how long they can continue to last if each continues to challenge the other in this way?

Such as? These are just glorified toys we're talking about. I don't
really care if someone has managed to turn a C64 with a bunch of
extra hardware into a network web server.

: >-some- things. But it makes it a hell of a lot easier to get started.)
:
: Forcing the user to type something to get going is easier than
: autobooting software? Easier for who? Lazy programmers? Certainly
: not the user.

I think you guys are missing the point--what you give up in autobooting,
you gain in having instantaneous access to BASIC. No cartridge required.
THAT was the reason, not some deficiency in the R&D or outright malice. A
bit more useful than booting into a notepad, methinks.

: >This is a bit of an oversimplification. The 64 has a pretty wide variety
: >of graphical modes that have been "discovered" over time,
:
: How about some specifics here?

I'll see what I can do about working up a list. No, it's not likely to be
the massive tome Atari computers since the 400 to the Falcon have enjoyed
putting up. But people have found ways to interlace the display which
leads to some very interesting results. The 16 color barrier has also
been broken. You see, you can trick the 64's VIC chip into generating
colors beyond its normal set because of the way it stores and displays
them. It in effect tries to display one color on top of another.

: >and you most
: >certainly can switch between them on a single screen.
:
: It requires assembly code to service an interrupt which makes
: it impossible for a BASIC programmer. On the Atari you only
: have to change some bytes in the display list. There is also
: support built into the OS for a text window on most graphics
: modes. The Atari doesn't resort to ML interrupts until you
: want to put extra color on the screen, cut up players/missiles,
: use multiple character sets, etc.

Ok, fair enough. However, the method was very well documented for
assembly programmers (wasn't there some issue of Atari keeping all of its
developer material secret for a very long time?)

: >No big deal, you learn pretty quick that LOAD"*",8,1 gets you started with

: discovers a deficient and more user-hostile interface.

I think it's reasonable, you don't. This is hardly going to go much
further. Let me just say that I -greatly- preferred the process of typing
in a load command to creating a boot disk on another computer.

: It's that other 10% of the software that makes life with
: a C64 irritating.

That all comes with booting instructions. Probably right on the label,
too.

: >: 2. couldn't display upper and lower case text simultaneously
:
: >This is an outright lie.
:
: Maybe he means graphics characters and lower case?

Maybe you mean that, he quite clearly said "upper and lower case," but
it's -still- not 100% true, only in default mode. You can do all sorts of
impressive things with remapping the character set.

: As I recall most of my friends had to type arcane things
: to do things like rename files, etc.; until one of them
: bought one of those quick load cartridges. In the end,
: to make their C64s behave more like Ataris most people
: ended up buying enough extras to make the C64 cost more.

As a 64 user who bought some of those things, I can assure you that the
goal was not to make my machine act more like an Atari. I like the Atari
I have (got it a couple of years ago), and while it's very neat I have no
regrets about having a 64 as my primary computer during those formative
years.

The DOS wedge was standard on the 1541 disk. There were also plenty of
programs you could use (much like booting into a DOS) to automate the
process of formatting, deleting, etc.

(And tacking on an extra $40-$50 bucks was often well worth it, as the
later cartridges did things I've never heard a stock Atari coming close
to.)

: >People knew exactly what they were buying--a cheap, good computer for

I guess I grew up on a different block than you. We all welcomed our 64s.
I hardly feel "bamboozled." And it didn't take very long for that support
to emerge--by 1983, most major software companies were putting out 64
versions side-by-side everything else.

OK, my 2 bits...

I, too, am a Jay Miner fan. I went from Atari 8 bits to Amiga because I wanted to follow his designs. When I looked for the first computer I could afford, the prices narrowed the choice down to an Atari 400 with that awful membrane keyboard, and a Vic 20. I read Compute and Byte magazines all the time and decided on the 400. Yes, the Vic had a much better keyboard and I had been programming my father's PET, so you'd think I'd have gone with the Vic. But when I found out about the huge choice of playfield graphics modes, the Antic and GTIA, the color indirection, and the priorities you could place on player-missles, I had to have an Atari. A series of articles in Byte was what really got be going.
So even though I had a lot of fun with that old PET computer, Atari won my heart.
And by the way, the lack of BASIC in the first Ataris was just something ahead of their time. Atari wanted the first computers for the home to be something that wasn't expected to be programmed, but ready to use with programs already written. Kind of like things are today.

Bryan Edewaard wrote,

>>Actually, Atari owners do have a reason to dislike the 64. The 64 is
>>inferior in just about every way.

(whew) - You Atarians are a mellow bunch, aren't you?

My entire point seems to have been lost.

The c64, Atari, and Apple II boxes are the only
6502 machines standing, i.e., still have a user base.

I wanted to avoid a flame war(which is why I didn't crosspost to comp.sys.cbm)
but it seems you guys are extremely bitter about the market success of the c64.

I wanted to get beyond the "my machine can beat-up your machine" mentality.

I guess I'll play CBM advocate respond...

>>These machines have a 65XX in common, and it pretty much stops there.

Nope, how about these simularities: Player Missles - Sprites, Joystick/Paddles,
320x192 screen - 320x200 screen, Intelligent Peripherals, etc.

>>I own a 64 and play with it from time to time, but here's a
>>comparitive list of the 2 machines' features.

>>Atari: Full extendable OS with device virtualization and auto boot
>>capability.

The old "Only Atari has a true OS" argument doesn't fly. Just 'cause
you due everything through one call, that doesn't make it superior.
The c64 has plenty virtual devices like ramdisks.

If I want autoboot, I'll start up in 128 mode.
What's that you say? The 128 isn't a true c64?
Thats another thing, CBM line continued to advance and improve.
Atari's are essentially unchanged since the old 800.

>>Commodore: "Kernel" containing start-up code, and a library of
>>dedicated hardware routines.

Nope, hardly dedicated. CBM uses a jump table of calls, many of them
vectored thru RAM - very extensible. The same 'CHROUT' call will work
on all CBM machines from the PET to the 128.

>>Atari: Unified serial interface for chained IO expansion.

And that's where Atari's IO ends(discounting joysticks)

The c64 had a "dedicated serial interface for chained IO expansion"
- what's your point? - that the Atari is better because it only has one port?
You had to pay big bucks just to get a serial connection.

>>Commodore: Several different dedicated ports.

Well let's take em one at a time...
User Port, hardly dedicated, it was used for modems, data acquisition,
printer interfaces, RS-232, etc.

The c64 device bus was a serial version of the IEEE interface
(although admittedly slow at first.)

The cartridge port allows DMA, for accelerators (4MHz 65C02, 20MHz 65816, etc),
for foreign CPUs like the Z-80, etc.

>>Atari: 4 voice sound chip, square wave
Wow, just like the Vic-20.

>>with poly-pattern generators, 8-bit pitch resolution (optional 16-bit mode)
Sure you can do stuff, if you want to eat up CPU cycles.

>>Commodore: 3 voice sound chip with waveform and envelope control.
>>12-bit pitch resolution.

You left out the programmable filter, ring modulation, external audio
input, white-noise/random number generator and synchronization.

I could go on here, but we could argue features back and fourth
for eternity.

Face it, these machines are brothers and the differences are petty
and insignifigant.

It's like arguing Catholic/Protestant or Democrat/Republican.

In the mean time, where is Atari development going?

You can piss & moan about commies all you want, but in terms
of modern development, the CBMers are blowing you guys away.

Period.

In the old days of Compute magazine, many Atarians/CBMers worked together,
why can't we revive that spirit?

Or you can sit back and watch your platform shrivel because,
"c64's don't autoboot!"

Stupid.

N.V.

Trammiel succeeded first at Commodore selling low priced calculators. He repeated this successful "sell 'em cheap" formula with the Commodore 64 and 128, running out his other 8-bit competitors by being the least expensive and using market leverage to monopolize retail outlets (boy, that sounds like Internet Explorer!). He attempted to do the same with the Atari ST, but cheap PC clones, Atari's unfortunate "video game machine" image, and lingering resentment of both Atari's and Trammiel's earlier hardball tactics with developers and retailers doomed Atari as a computer company.

Tom,

You could go RF to VGA, there are several commercial stand alone converter boxes, they are beginning to drop in price to about $79 or so, you'll have to look around, all it does it take RF coax signal and seperate it to VGA output, then you could go out and buy a low end VGA monitor (I'm seeing NEC 2a monitors selling for $99 and less in many places) which is benefitial because Composite monitors are becomming more and more scarce these days.

Curt

237. 65816, better Antic?

Apple][slots were specialized, they had one slot that only took a parallel, another for serial, another for mem/video and so forth, the Apple][is a remarkably simple machine. The problem with the Atari's is that they are more advanced, then you run into the fact that the ANTIC itself is a CPU and basically is a major headache. Hey Bob, I'm sure you'll read this, what would it take to create a new "Enhanced Antic"? with better resolution to finally solve the 80 column shortcomming of the 8bits? A duaghter card plug-in for the Antic with its own seperate memory and perhaps its own Freddie to handle MMU operations, called it "FrAntic" ? Somewhere out there are the specs to the ANTIC, you more then most seem to know the 8-bit intimately, what would it take, who would be needed and what type of cost are we talking?

More linear memory would be wonderful, TCP-IP and better graphics are a must, better graphics could mean a web browser (perhaps 640 X 200 or 400 at 256 colors) Now that I would pay for without a doubt!!!

Curt

double on that. I'm proud of using a C64. The only reason I once chose
for the C64 was the fact that all my friends and nephews had a C64. The
Apple was out of the question anyway, since it was too expensive.

I never regretted my choice, and, probably, I never will. But, that
doesn't mean I see the "atari-crew" as The Big Enemy.

>
> I wanted to avoid a flame war(which is why I didn't crosspost to comp.sys.cbm)
You did :P

<snipped quite a lot of arguments why a insert_brand_here is better than...>

> for eternity.

I'll be the last one to say I don't love my C64 (or any other Commodore
computer I have). I truly do. However, I do think that both platforms
might be better off cooperating a bit more (Like Noah stated).

>

Well.. It's fine with me that Atari- and CBM-folks argue, but I'd truly
like to see both groups shake hands when dealing with 'the external
world.'

> In the old days of Compute magazine, many Atarians/CBMers worked together,
> why can't we revive that spirit?
Well, for what's worth, I don't have any 'personal problems' with Atari

users.

The C128 was released after Trammiel left. Also, why do you dislike
Trammiel so much? He brought computers in general into the price range
of ordinary people. Other platforms had to lower their prices to compete
with him. Why is everybody so negative about him?

: wrote:
:
: >I disagree with this contention, BTW. The 64's total lack of reliance on
: >an externally booted OS before the user gets real control of the machine
: >sets it apart in its generation. (Yes, this can be a disadvantage for
: >-some- things. But it makes it a hell of a lot easier to get started.)
:
: Actually, putting in a game having it load for you makes it a lot
: easier to get started. The Commodore does rely on an externally
: booted OS, but it gets from ROM in the 1541 pretty much setting your
: DOS in stone (until things like Fastload came along).

Sorry, I was referring to "started" as in "if you just got this computer and have absolutely nothing, no clue, you have a power supply and a TV and you turned it on." (I still say booting to BASIC rather than a notepad is more helpful and useful).

: Well, people have discovered manipulation tricks as they do on any
: platform, but the hardware spec is pretty simple. I'll get my book
: out and quote them if you want. The screen is ALWAYS arranged as
: cells which complicates anything other than tile-based graphics. (Not
: as bad as the ST's bitplanes which made pixel manipulation slow as
: mud).

Sure, you can basically say there's a 320x200 hi res or a multicolor mode that's half as wide.

: >: Commodore: Up to 8 sprites, multi-color.
: >
: >8 sprites per scan line, you mean.
:
: Well, if you use code (say, using the RASTER IRQ), then yes, you can
: make more sprites further down the screen. The Atari re-fetches data
: for all 5 players on each scan-line, so 5 per scan line is actually
: correct.

(Which I think the original post said.) My expansion was to make sure people didn't get the wrong idea about what you can do with those 8 sprites.

: > 2. couldn't display upper and lower case text simultaneously
: >This is an outright lie.
:
: Okay, "Didn't". The default screen handler actually swaps character

: sets when you hit the caps lock key changing all text on the screen.
: Kinda quirky.

Are you thinking of "shift-commodore"? That's what swaps the character sets. Hitting caps lock doesn't do anything except act as a caps lock key. (and actually it's a shift lock key) And you're STILL not getting the point--in its most basic (and BASIC, for that matter) and default state, you could choose from upper-case and "shift-graphics", or upper-case and lower case, selectable either by a simple call in a program or by shift-commodore as a user. (and in both modes you have access to the "commodore-shifted" graphics.)

: I knew many people with 64's who got their first 1541 and then had no
: simple way to manage files. I am not familiar with the test disk, but
: I never bought a new 1541, and never got this disk with collections I
: got from other people.

Ok. Well, I am pretty sure every new 1541 shipped with one. So, yes, from BASIC entering DOS commands is somewhat annoying, but you got a disk with utilities to automate most of it anyway. Or, you slap in a $40 cartridge (which you probably want anyway because of how damn slow the 1541 can be) and make it all a lot easier.

: >The Atari's layout is a little weird, too. Hardly a "difference" in this
: >department.
:
: Okay, but who said, "We need a big dedicated Pound key!" and how about
: a big one one called "Restore."

1. People who (quite rightly!) felt that the machine would sell well in the UK.
2. Why is restore particularly different than a reset key as found on the Atari? Restore is actually extremely useful from a programming standpoint. I always found it interesting that Commodore dropped the restore key from their later 8-bits (the +4, the 16, the planned 364 and LCD)

: Interesting. I'm in the position of having been a life-long Atari
: supporter who now favors the Amiga and feels the ST was an unnecessary
: complication in the 16-bit market. I no longer play the brand loyalty
: game, and as a hardware engineer familiar with each system, I'm a
: greater supporter of the actual computer makers: the engineers. Did
: you know that J. Miner and several other engineers left Atari because
: they wouldn't let him build his new 68000 based computer? The Amiga
: owes a great deal to the Atari 800, and practically nothing to the 64.
: Those people went and bought Atari and produced the next generation 64
: and sold it for less. I wish I'd been smart enough back then to buy
: an Amiga.

I'm very well aware of Jay Miner and the entire history of the Amiga, yes, including the fact that Atari came fairly close to buying Amiga Inc. And yes, I fully appreciate that the Amiga's custom chip design is a logical extension of the work Miner did on the chips for the 8-bit Ataris, and

that the 64 and Amiga are cousins basically in name alone.

I'm not saying the Atari isn't a very neat computer. All I came into
this saying was that the 64 is a lot better than you guys are giving it
credit for.

Stevens Institute of Technology (Hoboken, NJ) was one of the first colleges to require that engineering students buy a computer. At one point the required computer was an Atari 800. By the time that I applied there (1983) they had just switched to DEC Rainbows (or one of the other DEC PDP-in-a-box machines, before DEC made PC clones). There was also a school in Virginia (Virginia Institue of Technology?) that required students to buy Atari 800s.

AFAIK, the 128 was done by Commodore AFTER Jack was tossed out.

With Jack T gone, Commodore rewarded the loyal 64 people with a
machine that had real color 80 column text, higher resolution
graphics, a faster processor, 128K memory, a new BASIC that
supported the extra memory, and to top it all off it was the most
reliable 8-bit that Commodore made.

What we got from Jack after he moved to Atari was a 800XL with
an extra 64 K slapped onto it (with no additional support from
BASIC), cheap keyboards, cheaper peripherals, and nothing else.
Our 80 column text is a silly monochrome terminal that connects
to the joystick port. I'm almost embarrassed to mention it.
At least he didn't make it mostly incompatible with the preceeding
8-bits which seemed to be the normal design requirements for
Commodore's computers under his reign.

Sometimes I wonder if Jack T wasn't just purposely trying to
make the 8-bits die as soon as possible. He spent years at
Commodore trying to plow them into the ground. Hmmm, kinda
like the Remington shaver commercials in reverse; "I hated the
company so much I had to buy it to kill it."

I think the Dade county (miami area) school system was using
Atari 800s exclusively some years ago. I think I read that
in an old Atari Connection magazine.

Boot tape: Put the tape in the tape player
press down the play button on the tapr player
Hold down the Start key when you turn on the 800.
The computer should beep once.
Let go of start and hit any regulat key on the keyboard.

Boot disk: Turn on the floppy drive
Put the disk in the floppy drive.
Turn on the 800.

If these are really boot disk/tapes they probably don't require
BASIC, so you should have no cartridge in the left slot.

Well, take this as an example. I stood on my head for years trying to get
some of the guys in my 8-bit user group to use their modems for ANYTHING.
Now that the library system in my county is going to provide free Internet
service to its patrons some time in the spring, they're suddenly
interested. And they're not about to go out and buy PCs or Macs. They
want to access the Internet with their 8-bits, and I'd like to help them.
I'm sure the process will be repeated many times around the country. As
for glorified toys, just try pulling a toy gun on a cop and see what
happens (well, that's a little extreme, but I I think I'm making a point
here.)

A thread just started on c.s.cbm about connecting to the internet
with a C64. So far the only response has described simply using
a BBS-like dial-in to an ISP who provides accounts to use lynx,
telnet, etc (at a hideous 1200 baud no less.). This same method
has already been desribed for the Ataris and isn't really a big
deal or very complicated. I haven't actually seen any one on
c.s.cbm write about a real PPP/SLIP/TCP-IP stack yet. I'm beginning
to think that it's more hype than something practical or usable.

>>>But, doggone it, both communities have lasted longer than they were

I think we've got the most zealots left standing. Supposedly,
the C64 had an installed base of some millions of users, but the
traffic on c.s.cbm is pretty sparse compared to c.s.a.8bit.

Well, there were real graphics cards (a few with sprite support)
and 80 column cards for the Apples. The floppies weren't the
Atari/C64 funky serial beasts, so they were pretty fast without
any tricks. Having an ML monitor built in (albeit a simple one)
was useful for programming. The apple users even got a 65816
upgraded model with nice sound and decent graphics out of Apple.
But even though it was expensive I would put the Apples before
the C64.

Actually, you can hook up that 23G SCSI III drive - all SCSI drives are downward
compatible, and there are SCSI controllers for the C64. Why you would want such
a drive is beyond me, but you could do it if you had no life. :)

14 years ago, I used to love arguing Commodore vs. Atari (I will confess now that
I argued for the former camp). In retrospect, the obvious story is that each system
had some advantages over the other: the Atari had faster I/O, four-channel sound,
four joystick ports (on the 400 and 800), and the C64 had higher disk capacity
(on standard drives at least), superior quality sound (albeit with one less channel)
and a lot more support in the marketplace (hardware and software). To say that
one was inherently superior over the other is kind of stupid.

The Apple II newsgroup denizens are almost all positively certifiable.
It's nothing to do with platform advocacy--it's that they spend all their
time yelling at each other for various trespasses, real and imagined, and
very little time actually talking about the Apple II. No, I don't think
there's much to worry about from that quarter.

Not necessarily. I have a Quantum 4.3G SCSI II drive that
doesn't work well (sometimes not at all) with many plain
SCSI interfaces. And Ultra-Wide requires more than a
50 pin cable AFAIK. Also, partitioning something like that
could be a problem on an 8-bit. Until recently, even the
Amiga could only handle 4.0G drives due to 32-bit limitations
in the file system. (this has been upgraded to 64-bit now.)

>and there are SCSI controllers for the C64. Why you

I watched Jason boot his XL from one of my old Amiga's
80M SCSI drives yesterday. Impressive. It's about the
same as if DOS were in ROM.

258. Sidplay95 or STsound95 -esque proggie for Atari 8-bit sound?

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-09 00:00:00 UTC
From: Robert Hagenstr&#65533;m <rob@ksk.sala.se>
Message-ID: <01bd1d25$077140a0$9f2611c2@freja>
Source record: 67244

Greetings!

I was just wondering if there exists a music player like ST Sound 95 or Sidplay 95 on the PC that can play Atari 8-bit music extracted from the games (preferably from disk images).

My guess is it doesn't since I haven't even heard of it, but pherhaps if demand for it would make it loud on the net, such a program would be made availible by some kind programmer?

Yours Sincerely, Robert Hagenstr&#65533;m

Ps. If someone decides to do one, please send all the Alternate Reality tunes with the player over here! :)

259. How do you use cart (?) .exe files with emulators?

Greetings!

I've been searching for Montezuma's Revenge on an .atr or .xfd disk image
for ages, but I haven't been able to find one. I know there should exist
one, cause I'm damn sure I got a disk with it in my garage somewhere!

I have found, however, alot of .exe files of the game, which supposedly is
the cartridge version.

Now, if no one knows where I can find a disk image of it (no, not
jellystone or one of it's mirrors have it, atleast not one I could find)
coud someone please tell me how I can use the .exe file with an emulator
(if it's possible, that is).

Yours Sincerely, Robert Hagenstr&#65533;m

Then what are you doing here? If you consider 8-bits toys, get a NES
and go and play.

Hardly a toy - the 8-bit computer piloting Voyager, or the computer on the
Apollo missions were hardly toys. Military versions of the 6502/6510 exist,
what's the army doing, playing games? 6502's (Rockwell's) are still used
on the space shuttle. In many third world countries, c64's are all they
can afford.

Sure, if I want to do major word processing, I'll use TeX in Linux, but
there are alot of simple tasks I still use my "toy" for.

Sometimes a big OS just gets in the way.

> I haven't actually seen any one on

>

Of course, brand-bigot like you would form an opinion from one USENET response.

Have you even bothered to look?

Check out Andre Fachet's OS/A65 which runs on the C64 - I'm sure it
can be ported to the Atari by anyone who knows what he's doing.

http://www.tu-chemnitz.de/~fachat/8bit/osa/v2.0/index.html

Although hte SLIP stuff is alpha code, it's not vaporware,
here's a bit of the README.slip file...

" The TCP/SLIP implementation will someday be used for telneting to and
from an OS/A65 computer. Now it's used to transfer files between an
OS/A65 computer and a (Unix) computer. It can also be used as a simple
WWW server now.

I use it on a C64, to transfer files between a PC and a VC1541 disk.

The lowest level you can see is the icmp (internet control message
protocol) level. If you "ping" the OS/A65 computer, it replies.
See "man ping" on a Unix machine.
"

So we actually have a c64 transfering files by IP and the ability to act as
a simple web server.

Imagine that.

N.V.

Actually Kenneth,

Jack T. DID want the 8-bits to die quickly, all he cared about were is precious ST's, the Atari 7800 was done, packaged and ready to ship, but he shelved it for 2 years until Nintendo was doing so well and making so much money he said, gee I want some of that, lets sell those silly little video games again, too little too late. The 8-bits survived only from our constant nagging to Atari Corp for more, all the Tramiel cared about were their crippled ST's, it wasn't until 1992 with the Falcon030 that the ST's finally had the type of features they should have had from the start. I'll be the first 1 raise my hand that I'm a C= ommodore hater, but the fact is that the Amiga was designed by ex-Atari engineers, back by Atari, Inc money (over $500,000) and was already in the works as an Atari super advanced console and computer inside R&D right up to the day Atari was sold to the Tramiels, the Amiga was an Atari from day one and sometimes I wish Warner had held out a few more months, go the 1090XL out, the 7800 out and the "Mickey" Atari version of the Amiga. Atari would have held a strong position in the video game area, the XL line would have finally had expansion slots which would have lead to a lot more advancement then there are today and the Amiga would have brought in a super video game console and also Atari's new business class computer series. Commodore would then have closed its doors in 1985, with no new technology and new future system to use it would have gone bye-bye.

It could be that the stuff doesn't exist, or it does but the word hasn't
gone out, or it does but nobody is paying any attention to it in the C64
camp because it's too expensive or too hard to get. I don't log on to
their newsgroup, so I have to trust what you guys say.

Could be. How many people own Ataris and are only isolated users, with no
sense of community? How many people put their Ataris to use playing games
from floppies alone, or carts alone or (choke) tape alone? We don't really
know. I suspect that an even greater proportion of C64 owners fall into
that category, and that accounts for the high
installed-base-to-traffic-on-c.s.cbm ratio you've described.

Hi Jason,

If I had my choice: Amiga or ST, I would have gone Amiga.
Kenneth; actually the Amiga is a 4th generation of the Jay Minor
engineering genius. Jay Minor was given the project of creating the
Atari 2600 TIA/RIOT chipset, then his team worked on the
ANTIC/GTIA/POKEY/PIA chipset (actually it was intended for an new arcade
game/high end home console system.... which became the ill-fated 5200),
then came the MindSet computer, many don't know about this system which
was truly unbelievable, JVC bought it up and used it in-house mostly,
then the work on the Lorraine started, Jay need money, went to Atari and
Atari gave them a loan in exchange for exclusive rights to the chipset
which for the 1st year would be used as a video game console, and after
that a full blown computer system. However Amiga went to Commodore
when it needed more money, Commodore payed back the Atari loan and
bought Amiga, Atari took Amiga to court for violating its exclusive
rights clause, Atari won the suit and won an undisclosed royalty for
each chipset sold, I have the court dates and I'm working on seeing if I
can get a hold of the discission papers, for those who are doubters
about the Atari Amiga agreement, please visit my website at :
www.atari.nu, goto the Atari Archives and go to
the Atari Articles section and read: TOP SECRET: Confidential
Atari-Amiga Agreement

>
> -Bry
>
It was the intro of the Vic-20 and C64 that caused Atari to persue the "lets make it as cheap as possible to compete policy" and caused the Atari 800 design with its more open architecture to depreciate into the "Atari Edsil" The 1200XL, Atari fixed things by only a tiny bit when it introduced the 800XL, the 1090XL would have helped, but the PBI is plagued by timing issues, the 1400XL/1450XLD were actually a WASTE of Atari's time and resources, they should have simply created a large box and merged the 800XL and 1090XL into one, got rid of the voice synthesiser, floppy controller and modem and relied on expansion cards instead and had a detachable keyboard. I think people would have respected the Atari computer more if it had been released in that kind of configuration. That might have happened if the VIC and C64 weren't introduced (perhaps thats where the root of my hate of them comes from)

Then Atari could have sold a line of expansion cards like the 80 column card, a new graphics card, Z-80 card, 8088 card, parallel/serial, modem cards and 3rd party company's like ICD could have introduced HD controllers to mount internal HD's, even network cards could have been introduced. These were all outlined in the Atari 1090XL specs, if you want to see more about the 1090XL and its cards go to www.atari.nu, goto Atari Computers, Atari 8-bit systems, Atari XL series and then select Atari 1090XL and then Atari 1090 expansion cards.

Sorry to keep plugging my website, I just want people to see some of the items Atari HAD planned to intro if the King of Cheap: jack Tramiel hadn't of stepped in.

Yes a company called CMD makes several hardrives for the Commodore 64.
Any where from a 40 meg Scsi drive to a 2 gig Scsi drive. you can also
use other scsi devices with the hardrive such as a Zip drive.

There is also a person who will be releasing an IDE controller for the
C64 in a cartridge.
>

I think the largest ramdisk for the c64 is a Ramlink made by CMD, that
can use a max of 16 megs.

Hmmm... Not sure! but you can get a mod dos rom chip from CMD to make
the drives many times faster than stock.

Atari had it's most successful time with Mr. Tramiel.
The ST was a success (mainly in Europe). I still use
it, it's a very reliable machine.
The Falcon was one of the last amazing computers.
The Jaguar is a great piece of hardware.

I do agree that Mr. Tramiel is a buisnessman first.
But he always managed to have some great developers
around him.
They developed outstanding machines, the F030 is
still ahead of time in some points I think.

Sometimes I feel that Mr. Tramiel didn't catch up with
the spirit of selling computers in 90's.
It's hard to say, but I always felt his time was over when
guys like Mr. Gates entered the scene.

I understand many people's arguments here.
I know the development of the 8-bit's were much better
before Tramiel came to Atari.
But remember, the time for 8-bits had already come when he
took over Atari. Atari was nearly dead.
The ST was the right way to go, I think.

Lots of computers (in fact, just about all) have graphics.
I've even heard that more than a few have peripherals and
can use game controllers. None of these rather broad
generalizations makes the computers comparable or equal.

BTW, the Atari isn't limited to 320x192. It supports a
wide screen format for real overscan, in theory up to 384
pixels on a horizontal line. Also, the number of scan lines
is not limited to 192 scan lines. Display lists can be
created to go into the overscan area for 230+ scan lines.
(A thought just flashed by; Can any of the Atari 8-bit
emulators handle displays like this?)

>>>Atari: 4 voice sound chip, square wave
>Wow, just like the Vic-20.

>>>with poly-pattern generators, 8-bit pitch resolution (optional 16-bit mode)

Dream on.

>It's like arguing Catholic/Protestant or Democrat/Republican.

We all know Democrats eat babies, so what's your point? ;-)

>In the mean time, where is Atari development going?

About the same place the C64 is going. Nowhere.
The computers ceased to be supported by their
parent companies ages ago. They are nothing more
than hobbyist toys.

>You can piss & moan about commies all you want, but in terms
>of modern development, the CBMers are blowing you guys away.

You mean I can hook up our fiber-optic line to the C64
and FTP files at a Gigabyte per second? Can I hook up
a 23G ultra-wide SCSI III drive to the C64? Can I edit
non-linear video with D2 quality on the C64? I didn't
think so. So, you may park that "modern development"
fantasy on the front lawn, jack it up on blocks and
wait until plants start growing on the roof.

>In the old days of Compute magazine, many Atarians/CBMers worked together,
>why can't we revive that spirit?

Funny, but I don't remember that at all. And the Atari
versions of games they printed were usually better than
the C64 version, too.

>Or you can sit back and watch your platform shrivel because,
>"c64's don't autoboot!"

Both platforms shriveled up years ago. How did
you manage to miss this?

I thought of something else relating to the notepad. Not
having BASIC with the autbooting capability meant a dealer could
leave an Atari 8-bit relatively unattended with a autobooting
game on a floppy.

Because the C64 goes straight to BASIC anyone with half a clue
could mess up the dealers' day by typing the command to reformat
a disk. (This is just theory, really, I never did that [very
often] ;-)

Source record: 67315

I have been going through all my old(er) and found my old 800XL.

I am having trouble getting the software to load. I go through all the load stuff, CLOAD, OPTION+SELECT+RESET etc. but it refuses to load anything. I hear all the tape noise but it is just noise, it's not the distinctive loading noise. I think that it maybe the tape drive + the cable.

Ideas and where I can get a new cable and tape?

Better still, an emulator for the PC that would enable me to load the software through the soundcard like the Spectrum emulator.

Thanks,

Jake

: good old days as well as the Corvus hard disk. the MIO and Black BOx I
: feel revolutionized HDs on the 8bit.

There have been more (and more continue to be developed) but there are a couple of notables.

The Lt. Kernal was a SCSI host adapter that interfaced through the 64's cartridge port. It also offered a freezer utility, although (so I've heard) you could only use the frozen programs off of the HD (you couldn't use it to pirate software--again, in theory.) Most 64 BBSes I was on with hard drives in the late 80s used one of these--first with 20 megs, then as people discovered falling SCSI HD prices and the ability to chain them, 200 or more megs.

The CMD HD is still manufactured by CMD today. It interfaces through the regular serial disk drive interface on all 64s, or (optionally) the CMD RamLink, the ramdisk expansion device (see below for more info.) It, too, is SCSI based.

There are other solutions--a new IDE controller has just come around, so I've heard.

: Is there a device that allows a C64 to access over 100 megs of hard drive
: space (using MFM/RLL and EVEN SCSI or IDE hard disks?)

Yes, both the LTK and the CMD allow quite a lot of space. CMD will sell you a 2 gig HD. You have to allocate partitions of no larger than 16 megs, though.

: Someone mentioned C64s have ramdisk support? The 8bit had it with the
: Axlon way way back.. and what is the ramdisk size limit on the c64?

64 RAM expansion can get confusing because it's never regular system memory. If you want RAM expansion for ramdisk use, you'd get a CMD RamLink, which plugs into the cartridge port (with a passthrough). The Ramlink effectively acts like a superfast CMD hard drive, it's partitionable, can simulate 1541/1571/1581 floppy images, etc. 16 meg limit.

: And speed! How fast is the fastest C64 floppy? fastest C64 Hard disk?

I've seen programs off of a 1541 load quite fast, probably around 6-8k/sec when used with the Warp*25 loader (software only). I don't know what the

fastest HD is--with the parallel access the RamLink affords, the CMD HD
can load at 50k/s, I believe.

Well, FWIW, I have no truck with Atari users either. <rant>And I had no truck with Speccy users until that crosspost war a few months ago told me just how many wretched fools in the Spectrum community are wrangled up that the Spectrum sucked wind outside of the UK.</rant>

I agree with you. There are a lot of similarities in a general sense between the Atari 8-bits and the Commodore 8-bits. Hell, there's a lot of superficial similarity between the ST and the Amiga too. But most of us hobbyists who have hung on to our machines for years (over 13 years in my case) aren't here so we can play pacifist with the other people who are equally nostalgic. We're here to keep it alive. Somehow people read into that that you need to say 'your computer sucks by virtue of it not being an [x]' -- no opinion volunteered.

I remember the German magazine "Happy Computer" (The best multi-platform magazine I have known, sadly it went into the dumps a few months after it was converted into a PC magazine, only the "Power Play" part survived as independent Mag) at least once, and I think more often, published Machine Code (!) Programs that would work on both Atari and Commodore with small modifications. Alright, they were nothing overly fancy, but hey, it worked. Why not do that again ?

I am searching for an old Atari XL game called "Smack vs. Bricks". It was
the first game I got for my Atari 600XL and I liked it very much.
Unfortunately I've sold my Atari many years ago.

Does anyone knows where to get a copy of the cassette or a file
representing it which can be used with one of the emulators ?
I've looked for it in a lot of the known archives, but could not find it.
Please send me an email if you can help me.

Best regards,

Andreas.

Hi,

It has been claimed that someone is intentionally, and at their own discretion, deleting posts in this group. Here is the claim:

"I deleted them (posts) all, but I think there were more than that... AND he changed the titles a few times so his 1115 lines came up as at least three different threads."

I do not believe this is a moderated group, and as such, deleting posts that are not your own is something someone should not be doing. It should NOT be up to one individual (or a few individuals) to determine what it is that gets posted in this news group.

Using one of the PC Super I/O chips would offer a lot in one package
(twin RS-232's with 16-bit FIFO buffers, EPP/ECP printer port, IDE,
and hi-density floppy controller). The problem with using such a chip,
from what I understand, stems from its orientation to be interfaced to
an 8Mhz (or faster) 16-bit x86 CPU bus, vs. the 8-bit, 1.79Mhz 65xx
bus the Atari offers.

Still, if you would be using a second CPU as a controller, why not go
with an x86 compatible CPU (a low end x86 CPU or x86-based
micrcontroller or embedded processor) as the controller instead, which
would apparently solve the interfacing issues?

>I am unsure how Apple II cards work but:
>1) I doubt they memory map into any space that is compatible with the 800.

Off the top of my head, I do not know how much address space they take up, but they almost certainly map the I/O hardware into somewhere in the upper 16K, as they did not interfere or subtract from the maximum 48K of RAM available on the original Apple II/II+.

Keep in mind that just because an Apple II series machine maps a slot in a specific location, an Atari implementation need not do the same. Keeping in mind that such an expansion was proposed in conjuction with a 65816-based machine, which offers a 16-megabyte address space, the small amount of memory space consuming for addressing the slots should not be an issue.

>2) Even if they do, chances are their driver ROMS are incompatible with
>the Atari.

For those cards that do actually use driver ROMs, simply do not utilize the code, or replace the ROM with one coded for the Atari. The point here is to cut down on the the amount of hardware that has to specifically be engineered and created.

>3) There is already an existing standard for the XL/XE. There's no reason
>not to use the PBI, except maybe for the fact that there are not the extended
>A16-A23 address lines on it.

How much hardware exists for this "existing standard"? Even if the new bus used the same pinouts and provided a form factor that would allow, for example, a Black Box board to plug into it, as well as an 800XL, the percentage increase in the number of PBI-equipped machines would in reality, be small. How many new boards do you see being designed for the PBI?

The fact is, engineering devices and laying out PCB's are talents very few people interested in the A8 seem to have. Then you have to have the money to get a large enough run of the PC boards done so that the cost per device is semi-reasonable.

Simply but, you get more "bang for the buck" if you go with off-the-shelf devices. For that matter, some times you get no bang at all if you don't. (Seen anyone offering SVGA cards for the PBI bus lately)?

Regarding emulating an Atari 8-bit on an Apple IIgs:

>Unless there is some sort of memory protection mechanism in the 65816 I
>am unaware of, there is no way to trap the custom hardware accesses.

While an MMU would certainly help, the ST 8-bit emulators seem to
manage well without it.

My main point in bringing this up was that no one has apparently even
attempted an A8 emulator for the IIgs. Without the need for CPU
emulation, one would think a rather BASIC emulator (i.e, supporting
most non-game applications and some of the more basic games) would
fly, especially on an accelerated GS.

It must be that GS owners (other than myself <grin>) have no interest
in seeing an Atari 8-bit emulated on their machine. This would be
strange considering PC, ST, Amiga, and Mac owners have, but still, I
could believe it.

>I'd kinda like to see either a PCI bridge for the 6502 or a Atari on a card.
>It's still more hardware work than my pea-sized brain is capable of though.

Mine too...not to mention the funds to create the first run of the
hardware, even if I did have the know-how to design it.

I have long been puzzled, however, why none of these emulators have
packaged a card with a high-speed version of the CPU for the machine
they are emulating. With the burden of emulating the CPU taken off the
emulating machine's CPU, it could work specifically on emulating the
custom components better, and the end result could be a very
compatible emulator that runs faster than the original machine.

As to an Atari 8-bit on a PCI (or even an ISA) card, I think this is a
good idea. One could even offer the card with empty sockets for the
Atari custom chips, so those with an 8-bit with socketed chips, or
other on-hand source of them would save a few bucks. Software packaged
with the board could support using the PC's display keyboard, joyports
and/or drives, as well as still supporting the standard SIO, video
connections, and joystick connections off the back of the board for
those who preferred it. (Due to the width limitations of the backplate
on PC slots, the SIO would need to use custom cable, going from a
smaller form factor connection, to a standard SIO connector on at the
other end. Video would either need to use the same approach, or go
with RCA jacks for composite video and audio, and a S-video jack for
chroma/luma).

Since the connection would be over a high speed bus, rather than a
relatively low-speed SIO-to-RS232 connection, emulating PBI devices
such as the MIO or Blackbox using the PC's resources would become a
realistic propostion, greatly enhancing the value of such a "Atari on
a card". I can see the ad copy now: "Buy our $99 PCAtari card, and get
all the functionality of a Transkey + Black Box + Floppy Board for
free". (Of course, you would need a SCSI interface on your PC to get
the direct equivalent of the SCSI interface, but IDE would make an

acceptable substitute for many folks).

For those folks who would prefer to use the Atari native video output rather than emulate it, and do not want a second montor on their desk (and do not already have a video-to-SVGA solution), offer a TV/tuner video daughtercard. If the specs of another existing solution were used, designed and manufacturing such a card could be avoided, as an existing card could be offered. Another alternative would be to simply advertise a variety of such solutions (ATI All-in-Wonder, Rainbow Runner, stand alone TV tuners, etc.) alongside the PCAtari card.

Why mess around with RF (unless you have an 600XL or 400)? All of
these external TV-to-VGA boxes I have seen offer composite video
inputs in addition to the RF tuner input (and all but one offer
S-video, which is chroma/luma input).

>...then you could go out and buy a low end VGA monitor (I'm seeing

If you are buying used, it is not too difficult to find a VGA (not
SVGA) monitor for even less then $99. Around $65 seems to be a good
price.

I have even seen used SVGA and multiscans for less, but most of those
bargains do not pop up every day. One exception is Advanced Recovery,
which regularly posts refurbished 13" SVGA for sale for $49 each in
the misc.forsale.computers.monitors newsgroup.

Tandy used a similar resistor network setup in their Orchestra-90 cart
for the Color Computer 3. Essentially, it was simple TTL chip with 8
outputs, mapped into a specific location, with resistors of different
values on each of the 8 outputs, and the outputs from the resistors
tied together to the audio output. (The cart also included a ROM with
a music composer/player application).

Certainly this is a workable solution, but from what I understand, D/A
convertors give better results, and are relatively cheap nowadays. One
could also look into using an 8-bit (or even 16-bit) codec, which
would offer both playback and digitizing capabilities.

>>I did some sampling on my PC, to record Cd quality 44khz sound for like 10
>>seconds takes nearly a meg of RAM. Perhap WAV is a space waster file
>>format.. i dont know.. but It would be very cool if it could be done.

WAV is a raw format, with no compression. On a PC, various software
codecs are available, but most are more suitable for voice than music.

MPEG audio layer-3 is the hot thing for PC music now. It essentially
offers the same quality as 16-bit 44.1Khz stereo WAV files, but takes
up MUCH less space. The problem with using such a scheme on the Atari,
however, is that it takes serious CPU power to decode in real time.
One solution would be to use a co-processor, either a DSP or a chips
specifically designed for decoding (and possibly encoding?) MPEG layer
3 audio.

There are, as you might suspect, MPEG layer 1 & 2 audio schemes, but I
am not certain what their capabilities are, or the amount of CPU power
they require for decoding and encoding.

The problem with high-quality digitized audio on any 8-bit machines
comes down to limited address space, and at least one the vast
majority of machines in the user base, slow drive transfer rates.
(Most MIO or Black Box users with a SCSI drive could likely spool
8-bit or perhaps even 16-bit audio digitized at high rates from disk
fast enough for playback, but those of use with a 1050 or XF551
probably would not do as well <grin>).

The data rates would range from just under 22K per second for a single
channel of 8-bit sound sampled at 22Khz, to 16 times that for

CD-quality 44.1Khz-sampled 16-bit sound in stereo. (The "1x" data rate
for CD's is around 150K/second, to put is another way, although due to
less space used for error checking and correction, audio data is
actually at a slightly higher rate; by my calculations, about
172.26562 bytes per second).

wrote:

Yeah, Bob, but how many of we ordinary folks can go out and buy this
stuff and install it on our Ataris? <grin>

As to the 100MB/second DOS, I suspect that was supposed to be either a
small "b" (bits, not bytes), and "K" instead of "MB". Even then, if
they really stated that, it was probably a reference to the rate at
which it can transfer data between the C64 or C-128 and their RAMLink
device (think of the memory in a MIO for comparison, although the
RAMLink is has a larger capacity, and has a relatively inexpensive
battery backup option available), or possibly even between the RAMLink
and their 20Mhz SuperCPU add-on.

I will have to say I never recall seeing CMD make any 100MB/second
claims for JiffyDOS.

As to GEOS, unless you wrote something like it for your own machine, I
sincerely doubt anything like it exists for the Atari. Some folks
might mistake it for as a simple GUI, when nothing could be further
from the truth. It is an alternative, fully-developed graphical OS,
utilizing a bitmapped screen and virtual memory techniques (which is
why it is a real pig if you try to run it without a RAM expander of
some type). I have seen nothing that compares to it on the Atari
8-bit. Even is, and I am not aware of it, it certainly would appear to
lack the number of GEOS-specific applications available on the
Commodore, which range from Commercial (the apps that came with it,
those commercial apps sold separately [two notables are GeoPublish
and GeoFax], to even even larger quanity of shareware and freeware
applications and utitilies.

I can phone up CMD (or one of the admittedly few Commodore 8-bit
dealers), and order the following:

A 20Mhz 65816-based accelerator for $199

A RAMdisk device that can have up to 16 megabytes of RAM (using up to
four 30-pin SIMMs). $189 w/1meg installed. Optional battery backup
unit available for $24.95

High density 3.5" floppy drive (1.6MB for Commodore); $179

57.6Kbps (faster speeds available for C-128 or SuperCPU owners) RS-232
port cartridge: $39.95

What do you have on your 8-bit that compares? Better yet, and more along the lines of the point I believe the person to whom you replied was trying to make, how many of these items can your average Joe Atarian call up and order from someplace ready-made, ready to plug and go, no soldering iron required?

The only device above that I am aware of that has an close off-the-shelf equivalent for the Atari is the hi-density drive, which requires a Black Box, floppy board, and of course, a standard high-density drive, which certainly totals more than $179 (but to be fair, the Black Box offers more than just a high density floppy interface, which is why it costs more).

I have heard hi-density 3.5" drive solutions exist in Europe, but I am not certain if any are available as "off-the-shelf" items, or simply as kits or just instructions. Certainly I have never seen any available from anyone in the US that you could call up and order one from.

In theory, it might be possible, but along with rewiring the connector
to be compatible with the Atari 8-bit (and only a 130XE's ECI port has
all the lines available externally), one would have to reprogram the
CLPD (custom logic programmble device, I believe) to be compatible
with the Atari's memory map and I/O locations, as well as supplying a
new ROM. In other words, you would almost have to redesign it. <grin>

As a person who owns a C-128 (in addition to my 1200XL and other
computers, both Atari and not), I have been following this. From what
I understand, this software is still in what some would refer to as
"beta" form, and currently supports only SLIP, not the more common
PPP.

Still, I have to admit that even this is more than seems to be
available for the Atari.

>2. The graphical interface (GEOS). Someone mentioned a German written

Actually, GEOS is a lot more than simply a graphical user interface,
but rather an alternative operating system that happens to utilize a
graphical user interface.

It would be interesting to see if an adaptation of GEOS for the Atari
8-bits could be created that would run 64 GEOS applications, without
requiring modifications to the applications themselves. As GEOS is
supposed to provide enough OS support that hitting the hardware
directly is rarely necessary, this might be feasible.

The slots themselves were not specialized (except for the "auxillary"
slot in the IIe or the memory slot in the IIgs, which were not
comatible with even II-series boards designed for the other slots).
Rather, certain functions were assigned by convention to specific
slots. Nothing in the hardware, for example, limits you to putting the
floppy disk controller in a slot other than #6, but since most
software expects it to be there, and providing no method of choosing
another option, it was best to put it there. Using such slots in
hardware in an Atari-compatible machine would mean using our own
software to address those cards, therefore such limitations of
convention would not apply.

There is a program (called "Star Commander" as I recall) for the
Commodore 64 that supports using the PC as a fileserver of this type.
I have also heard of another program called "Server64". These programs
seem to be less well known and less widely used among Commodore owners
than SIO2PC or APE among Atari owners, however. Whether this is due to
the software being inferior, or for other reasons, I do not yet know.

It could be that neither of these solutions support common fast
loading shemes and/or JiffyDOS, which would certainly explain part of
their lack of popularity.

Part of the problem in supporting such a setup on the Commodore is
that is its serial chaining port for perhipheral connections is a
synchronous (clocked) port, wheras the Atari SIO is apparently an
asynchonous port interally clocked at RS-232 compatible rates. This
greatly simplifies connection to an RS-232 port, wheras the Commodore
solutions connect to a parallel port, where a lot of bit-banging has
to take place for the serial data transfer and clocking, complicating
matters. While the RS-232 specs originally supported the provision of
external clocks, I do not believe that most modern PC serial hardware
supports this, meaning a C64-to-PC disk drive emulation that wanted to
avoid the parallel port route would have to resort to a PC card
specifically designed for the purpose of providing an interface.

>"beta" form, and currently supports only SLIP, not the more common
>PPP.

SLIP is actually a better form of connection than TCP/IP. A RISC
PC running a slip connection generally achieves a much more stable
connection than a windows box running tcp/ip. It also allows much
reliable sockets to be achieved than via a winsock. Using an Archimedes
with a 14.4 modem, 4 sockets are spawned to the news/mail server. As
soon as one drops, another is connected giving what appears to be a
continuous connection, the same for browsing. WINSOCKs are supposed
to achieve this but rarely do, with only one socket actually working.
Hence, our wonderful RISC PC on a 14.4 outperforms a pentium mmx using
a 33.6

One in the eye for wintel methinks.

Fair comment . . . I missed out the PPP part (which is of course
your standard windows method). The point is still the same though,
that SLIP is much a better way of achieving the connection :)

Kenneth Jennings (kenneth@spam.not.sayeth.i) wrote:

: You mean I can hook up our fiber-optic line to the C64
: and FTP files at a Gigabyte per second? Can I hook up

For what it is worth this article appeared in the June/July 1983 Midnite Software Gazette:

Fiber Network Focuses on Personal Computers
The first fiber-optic network designed to integrate personal computers into local nets is taking dead-on aim at the twisted-pair and coaxial-cable-based versions that have been available. Claiming that at $300 per connection its active-star fiber network built with 50 micrometer graded-index glass is competitive, American Photonic, Inc of Brewster, NY, introduced its 64Net at this week's Interface Show in Miami. The first version of the network, which comprises a remote terminal, a node, and network operating-system software, is geared for up to 32 Commodore 64 personal computers; other machines will be accomodated in the future, says the developer.

Not bad for an 8-bit 1 MHz computer. It even has FAX software these days. For a lot of people it is all they need for a home computer. If you want a GUI there is even one of those. New hardware and software development, in spite of the demise of Commodore, keep the machine running better than ever. If it doesn't meet your needs then don't use one but don't slam people who find that it still does meet their needs. Is the fellow driving a Model T a fool or a genius for making do with a machine that does what he wants? I couldn't begin to count the thousands of dollars I have likely saved by using my C-64 for the past 14 years and avoiding the 'buy the latest hardware to run your new software' treadmill so many PC users are on. That, however, is their choice. I have better things to do with my money.

That's not unusual, as there is a company here in Utah still using them
to create video clips
and trailers for TV-Commercials..Why buy something more expensive when
they still do what
the user has imagination to modify it to their needs....

There are some innovated programers still around attempting to push them
even further beyond
what Atari Corp. said they could do in the beginning.

Hackers keep up with hardware modifications, just because someone said
it couldn't be done,
have they ever proved Atari Corp. (second generation wrong!). Same old
adage Support
those that support you..?

One of the Killers on upgrades for the Atari 8-bit computer is Time, a
person thinks that a
product can be produced over night but later finds snags that slows the
whole project down.
Not to the fault of the person attempting to bring greater things along
for our computer users
but normal every day living prohibits many from completing what they
started or delays the
project as other items have a higher priority. Know that for a fact
been there done that and
have it done to me many times. I don't blame anyone for taking care of
a higher priority
first. Family comes first, we pushers for development, and users have
to come second.
Sooner or later they will get back and finish the project.

Let me stick my feble mind out here, been so long can't exactly
remember, on a Tape I believe
you hold down the Start Key, (don't worry if I am wrong as I said that
is so far back my
feble mind can't remember) but some one will delight in correcting me
and you get your
information.

On a Boot Disk, you do nothing if it is a basic disk just turn on the
drive and then the computer
800 and below you remove the cartridge if it is not a Basic type disk,
on 800Xl and above you
hold down the Option key to eliminate basic, on the 400, 800 and 1200XL
you remove the
Basic Cartridge prior to turning on the computer. Now if it doesn't
boot the disk does not
have an auto loader.. you may have to remove the carts if applicable and
go to dos and load
the game individualy. Clear as Mud?

Hope it helps

>>>on the space shuttle.

>Oh, really? Which one of these say "Commodore" or "Atari" on them?

Well, some of them have "MOS Technology" on them, which was owned by CBM. :)

You're missing my point entirely - some people don't look at these old
machines as toys, but as machines that can still perform useful services.

>>Then why are you bothering us with this? Make yourself a

Oh, I didn't realize that you had appointed yourself spokesperson,
guardian and censor of the Atari 8bit newgroup, it wasn't in the FAQs.

If I bother you, well, that's what killfiles are for.

>>comp.sys.nasa.6502 conference and have a ball -- talking to yourself.

Other people have resonded to this thread besides you, so someone's
listening. You seem to be the only one foaming at the mouth.

>>Hey, the printer up the hallway has a 68020 in it, so it must be an
>>Amiga. Let's go talk about it in c.s.amiga.hardware. Duh.

Really - where can I get one of these printers? I'd like to add a Blitter,
Copper, Agnus.....

Maybe you've hit on something here, maybe we need a "comp.sys.65xx" -
a place where we can leave our brand biases at the door and just get
to the heart of soft/hardware hacking.

>> I haven't actually seen any one on
>> c.s.cbm write about a real PPP/SLIP/TCP-IP stack yet. I'm beginning
>> to think that it's more hype than something practical or usable.

>>>Of course, brand-bigot like you would form an opinion from one USENET response.

>>>Have you even bothered to look?

>>Look where, since c.s.cbm seems to be devoid of any real
>>information? And where's your consideration of your

I don't think so.

>>poor C64 pals? For an entire day I didn't see you respond
>>to the request asking how to put a C64 in the net. You

An entire day? I'm sorry - how selfish of me. I should just
forget about the wife, kids, job, sleeping and scan the
all the newsgroups 24 hours a day.

64 Pals?, like we're a gang or something?
Can't you just drop you confrontational, devisive attitide?

I'm not a regular poster to either group, just an occasional lurker.
Users in each group are doing some great things, an exchange
would be profitable to both sides. But if you represent the
typical Atari user, there's no chance of that.

>>Check out Andre Fachet's OS/A65 which runs on the C64 - I'm sure it
>>can be ported to the Atari by anyone who knows what he's doing.

>> http://www.tu-chemnitz.de/~fachat/8bit/osa/v2.0/index.html

>>Although hte SLIP stuff is alpha code, it's not vaporware,
>>here's a bit of the README.slip file...

>>" The TCP/SLIP implementation will someday be used for telneting to and
>> from an OS/A65 computer.

>Two big words here. Alpha means breaks often. (And I saw the

No - really? Wow, you're smart! - can I be like you when I grow up?

>>words "very buggy" on the web pages; did you miss that?)
>>Someday means doesn't do much at the moment.

Well, he's transfering files back & forth, that's doing something.
Look at the amount of work he's done, we'll be looking at beta code
very soon.

If you would bother to look at the source code, you wouldn't be
saying that. I stated what it could already do - file transfer
and simple web server.

Mr. Fachet tends to be too humble in his efforts. He's done an
incredible job with his OS and his SLIP code.

I have no doubt that I'll be telneting into my Linux box someday.

>Also, if you actually bothered reading the web pages you'd see
>that he's completely replaced the C64 OS. In effect, to get

Just like many games and languages do.

How many DOSes and BASICs are there for the Atari?

>it to work it isn't a C64 anymore

Really, I took ALL the Bill Gates out of my Pentium box and
installed Linux, and guess what? It's still a Pentium. \
Imagine that.

>(I knew the existing computer was deficient.)

Why are there things like SpartaDos and Indus GT drives?
By your logic, that would make the stock Ataris defecient.

>So, congratulations; you've discovered that
>you can get a C64 on the internet if you throw away its
>personality and make it run an OS for which there is a software
>base of maybe a dozen programs.

You don't don't what you're talking about. Nothing stops me from
lifting the SLIP code out and using it as a program on the C64
with its native OS, or using it as a program on the Atari with
it's native OS.

SLIP is just a serial protocol, it can be ported to other OS's.

>I guess years of Commodore introducing new computer models
>mostly incompatible with previous computer has numbed Commodore

Let's see PETs, CBMs, VICs, C64's, C16/+4's, 128's, C65's.

All have compatable BASIC's even though the hardware advanced.

Incompatabilty with a previous generation is a fact of computer life.

The Atari hasn't really changed much since the original 800.

And that's sad.

>users to yet more incompatible stuff. I imagine most Atari users
>expect that running TCP/IP on an Atari means running it on
>something that still runs Atari software at the same time.

See above.

Oh, how I loved that game..... Don't suppose anyone has a copy for sale?
No, didn't thinks so. You seldom get games that show that level thought
in design and execution: the graphics were designed that they took so
much advantage of the strenghts of Atari 8bit it was incredible. What a
game.

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the
Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL,
800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend,
several people volunteer their time and energies by maintaining Periodic
Informational Postings for this newsgroup. Please take a moment to refer to
these documents before posting to comp.sys.atari.8bit. The answer to your
question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic
Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current

A couple of thingies here... SCSI Hard drives... easy. 20MB to whatever the biggest 7 drives you can chain together. I Kinda wish they went with IDE, for price reasons, but since I upgraded my HD-20 with a 100MB IBM SCSI drive, i don't think i'm gonna run outa room.

Fiber optic links... Impressive. Very impractical. A 28.9/33.6/56K/ISDN works just fine. Actually, anything with an RS-232 type interface. The latest UART cart from CMD can do 230.4Kbps. Twice as fast as any serial port in ANY peecee motherboard i've ever seen. That should do for a while.

Overscan... Neato. I've seen that kida stuff on a C64 for more than a decade. The game that comes to mind is Turbo Outrun. But, i know there are pleanty of others.

Now... as to the availability of power-hardware. Very easy to get for me. Accelerators, UART Carts, Hard Drives, RAM Expansion, even NEW hardware. http://www.cmdweb.com is the proof.

True, it's just one company, but they've been doing an excellent job for quite a while now, and i'm proud to own hardware/software from them.

PLEASE... let me know of any places on the web (or otherwise) selling Atari hardware of the like. I would be interesting in checking it out.

Power Star by Pandora -one of only 600 made-

This CARTRIDGE was obtain directly from the games programmer
He is the one that puts the count at exactly 600 made,
making this Cartridge almost impossible to find today

But this item also comes COMPLETE with BOX, and Instructions
Both are in Mint/Excellent Condition,

The game itself is a graphic adventure game for the Atari 130/400/600/800/XL/XE

I remember seeing one of the few MSX coputer ads in COMPUTE! magazine in
the 80s, it was for the Yamaha MSX computer, and there in a big bold
photo was the model name (clearly visible) of the monitor it was hooked
up to, "Commodore 1702". I guess the competition knows a good monitor
when it sees one. The guts of the 1702 is either JVC or Toshiba.

:From: "Geoff" <geoff.wallis@ndirect.co.uk>
:Date: Thu, 8 Jan 1998 18:23:10 +0000
:
:Dear Zzyzx,
:
:I too am disappointed that one of your packages has arrived in poor
:condition. However, I am even more concerned by the aggressive and
:impolite tone of your message and especially by your insinuations
:about my honesty.
:
:Firstly, both parcels were packaged more than adequately and I
:confirmed their suitability for posting to the USA with the Post
:Office before dispatching them to you. If one package has arrived in
:a poor state, I suggest that it has been mistreated or tampered with
:and advise you to contact your mail service to seek redress for the
:damage caused. It is possible that the damaged package was opened by
:US Customs and poorly repackaged.
:
:Secondly, I strongly resent your suggestion that I have deliberately
:sent you copies of the disks for 'Corruption' and 'Jinxter'. I assure
:you that these are the original disks as purchased in sealed packages
:from a
:reputable London retailer. Home-produced adventures were often
:released on unlabelled disks and I have a number where this is the
:case.
:
:Implicit in your message is the idea that I would send you the
:entire original contents of each game, but somehow

:decide to include an unoriginal disk. The idea in itself is
:nonsensical. You may be able to download the games from the Net, but
:the original disks I have sent you have a built-in copy-protect
:system which requires the rest of the package. I am sorry, but the
:games ARE original and I will not take them back.
:
:Thirdly, you say that a disk is missing from the 'Lost Treasures of
:Infocom Volume II'. I am extremely surprised by this as I
:double-checked the contents of the game box before packing it. I had
:previously also loaded all the adventures to ensure that everything
:was present. I certainly do not have a disk from this package here. I
:can only assume that one of the following has happened: 1) you have
:not loaded the four disks you have and compared the games loaded to
:those listed on the box; or 2) the package has been tampered with and
:a disk removed, in which case you should again seek redress from the
:US Mail.
:
:Finally, might I suggest that in future, before you give vent to your
:anger, you consider some of the benefits of civility and politeness.
:I have noted from your previous messages that you never
:begin nor end with a friendly greeting or remark nor have you ever
:informed me of your name (hence the lack of a proper greeting in this
:message). You might like to consider also whether implying dishonesty
:in others (especially someone who is as straight as a die) is likely
:to be the most productive form of action in the long run Had you
:sent me a friendly, but concerned, message, I would probably have
:refunded you some of your money as a good will gesture. As the matter
:stands, however, I am unable to do so.
:
:Yours sincerely,
:
:
:Geoff Wallis
:.

342. WTT: Astrochase (8-bit) for Astrochase (5200)

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-10 00:00:00 UTC
From: Mark Androvich <mandrovi@mail2.quiknet.com>
Message-ID: <01bd1d5e$de0d8040$24f0b7cf@rjiredff>
Source record: 67263

I recently received a boxed Astrochase for the Atari 8-bit computers.
Unfortunately, it does not appear to work on the 800XL computer I have. I
know that many carts that worked on the 400/800 computers had difficulty
with the XL line so I assume that this is one of them.

I really want this game for the 5200 instead. Does anyone want to trade?

Thanks,

Mark

From: atebit@wwa.com
Message-ID: <696h7m$l1r$1@hirame.wwa.com>
Source record: 67264

I need to build a cable for my 850 Interface.

Which pins on a DB25 need to go to which pins on the 850? It's only 4
right?

I'm assuming I can't just use a regular serial cable, I tried a couple
different modem/cable combinations, and they just don't work out right.

Thanks

Kenneth Jennings:
> You mean I can hook up our fiber-optic line to the C64 and FTP files at
> a Gigabyte per second?

Well, someone did manage to make a C64 act as an FTP server, will that do?
Why would you need to download files for a C64 that fast *anyway*?! =-)

> Can I hook up a 23G ultra-wide SCSI III drive to the C64? Can I edit
> non-linear video with D2 quality on the C64? I didn't think so. So,
> you may park that "modern development" fantasy on the front lawn, jack
> it up on blocks and wait until plants start growing on the roof.

Well, it sort of depends on your definition of "modern development" doesn't
it? For example, I expect that Noah means "current development" and there
is a lot of the that in the C64 scene, CMD are still releasing new hardware,
such as their HDD interfaces, RAM expansions and the SuperCPU accellerator
and a few European developers are still running businesses based at least
partially around C64 software.

As for the Atari side of things, I've been out of the loop for a long time
(thirteen years) are people still manufacturing new hardware for the Atari
8bit machines? (This is, I hasten to add, a serious question and I'd be
interested to know.)

Jim MacKenzie:
> Actually, you can hook up that 23G SCSI III drive - all SCSI drives are
> downward compatible, and there are SCSI controllers for the C64. Why
> you would want such a drive is beyond me, but you could do it if you had
> no life. :)

If I admit to having no life will you give me the drive to try doing it? =-)

> 14 years ago, I used to love arguing Commodore vs. Atari (I will confess
> now that I argued for the former camp). In retrospect, the obvious story
> is that each system had some advantages over the other: the Atari had
> faster I/O, four-channel sound, four joystick ports (on the 400 and 800),
> and the C64 had higher disk capacity (on standard drives at least),
> superior quality sound (albeit with one less channel)...

That *can* be rectified and no, I'm not talking digi here and again, no,
I don't mean with any kind of loss of CPU time or sound quality... =-)

> ...and a lot more support in the marketplace (hardware and software).
> To say that one was inherently superior over the other is kind of stupid.

I've got both machines. Sadly, since I never managed to get any software
for my Atari 800XL over here and none of the shops seemed to even know
where I could get a disk drive it's remained unused since I got my first
C64 in 1985...

I did like my Atari, but the music to Thrust wasn't as good as the C64
version and bugger did it take some time to load off tape...
--
Jason =-)

Subject: Re: FS: Lost Treasures of Infocom 1 & 2 plus....
From: "Geoff" <geoff.wallis@ndirect.co.uk>
Date: Thu, 8 Jan 1998 18:23:10 +0000

Dear Zzyzx,

I too am disappointed that one of your packages has arrived in poor condition. However, I am even more concerned by the aggressive and impolite tone of your message and especially by your insinuations about my honesty.

Firstly, both parcels were packaged more than adequately and I confirmed their suitability for posting to the USA with the Post Office before dispatching them to you. If one package has arrived in a poor state, I suggest that it has been mistreated or tampered with and advise you to contact your mail service to seek redress for the damage caused. It is possible that the damaged package was opened by US Customs and poorly repackaged.

Secondly, I strongly resent your suggestion that I have deliberately sent you copies of the disks for 'Corruption' and 'Jinxter'. I assure you that these are the original disks as purchased in sealed packages from a
reputable London retailer. Home-produced adventures were often released on unlabelled disks and I have a number where this is the case.

Implicit in your message is the idea that I would send you the entire original contents of each game, but somehow
decide to include an unoriginal disk. The idea in itself is nonsensical. You may be able to download the games from the Net, but the original disks I have sent you have a built-in copy-protect system which requires the rest of the package. I am sorry, but the games ARE original and I will not take them back.

Thirdly, you say that a disk is missing from the 'Lost Treasures of Infocom Volume II'. I am extremely surprised by this as I
double-checked the contents of the game box before packing it. I had previously also loaded all the adventures to ensure that everything was present. I certainly do not have a disk from this package here. I can only assume that one of the following has happened: 1) you have

not loaded the four disks you have and compared the games loaded to those listed on the box; or 2) the package has been tampered with and a disk removed, in which case you should again seek redress from the US Mail.

Finally, might I suggest that in future, before you give vent to your anger, you consider some of the benefits of civility and politeness. I have noted from your previous messages that you never begin nor end with a friendly greeting or remark nor have you ever informed me of your name (hence the lack of a proper greeting in this message). You might like to consider also whether implying dishonesty in others (especially someone who is as straight as a die) is likely to be the most productive form of action in the long run Had you sent me a friendly, but concerned, message, I would probably have refunded you some of your money as a good will gesture. As the matter stands, however, I am unable to do so.

Yours sincerely,

Geoff Wallis
.

Nintendo 64. And neither the NES, N64, OR the C64 have a Donkey Kong,
Defender, Missile Command, Millipede, etc. etc. etc. to compare with
the Atari's.

>Hardly a toy - the 8-bit computer piloting Voyager, or the computer on the

Oh, really? Which one of these say "Commodore" or "Atari" on them?
Then why are you bothering us with this? Make yourself a
comp.sys.nasa.6502 conference and have a ball -- talking to yourself.
Hey, the printer up the hallway has a 68020 in it, so it must be an
Amiga. Let's go talk about it in c.s.amiga.hardware. Duh.

>> I haven't actually seen any one on

>Of course, brand-bigot like you would form an opinion from one USENET response.

>Have you even bothered to look?

Look where, since c.s.cbm seems to be devoid of any real
information? And where's your consideration of your
poor C64 pals? For an entire day I didn't see you respond
to the request asking how to put a C64 in the net. You
only posted the information about alleged C64 TCP/IP in
this thread that you started cross-posting which probably
isn't the most intuitive place for the poor guy to look
for C64 networking information.

>Check out Andre Fachet's OS/A65 which runs on the C64 - I'm sure it

>here's a bit of the README.slip file...

>" The TCP/SLIP implementation will someday be used for telneting to and
> from an OS/A65 computer.

Two big words here. Alpha means breaks often. (And I saw the
words "very buggy" on the web pages; did you miss that?)
Someday means doesn't do much at the moment.

Also, if you actually bothered reading the web pages you'd see
that he's completely replaced the C64 OS. In effect, to get
it to work it isn't a C64 anymore (I knew the existing computer
was deficient.) So, congratulations; you've discovered that
you can get a C64 on the internet if you throw away its
personality and make it run an OS for which there is a software
base of maybe a dozen programs.

[etc. etc.]

>So we actually have a c64 transfering files by IP and the ability to act as
>a simple web server.

No you don't. You have a C64 shell running a different OS
in order to transfer files by TCP and the ability to act
as a VERY simple web server (if you read the web pages).

I guess years of Commodore introducing new computer models
mostly incompatible with previous computer has numbed Commodore
users to yet more incompatible stuff. I imagine most Atari users
expect that running TCP/IP on an Atari means running it on
something that still runs Atari software at the same time.

Well, buying via usenet contacts is tricky at the best of times. Especially so if you're buying from an overseas contact. I guess you know this which suggests that you must *really* have wanted the games, especially at the price you paid - thus your disappointment. Under no circumstances send disks by surface mail. I know, from personal experience, that US and British customs are bastards for opening packages: they usually put a green sticker on the package when it's been opened - how well they repackage them I don't know.

Well, I can definitely say that in terms of disk format there's no difference between PAL and NTSC games - the games are the same. There were some problems with compatibility between different models of Atari drives - I remember this being the case with a couple of games (I think one may have been an Infocom adventure.) I suppose also that the labels could, somewhere in the life of the disks, have been taken off: what brand are the disks? As for Infocom producing games without labels - never heard of that. Sure, home made games producers would but Infocom. Stranger things have happened though.

If the goods you bought were not as advertised then you have a case against the person you bought them from: this *is* the case for 'private' sales as well as sales from shops (in the UK.) It's going to cost you quite a bit of money to put it right though.

I think you're going to have to put this down to experience and kiss goodbye to the money you spent.

Also, the reply of Geoff Wallis does seem pretty sincere - maybe his *intentions* were good.

My trusty Atari 800 has long since died, so having downloaded the Atari800win emulator and spent about 4 hours with a stupid grin on my face writing a basic ascii
version version of pacman (it works too!) and probably about the same playing it I'm sitting here bemused. I used to use a tape drive with my Atari, yes, I've got
DOS working but I have no idea how to work it and hence save my programme, or even worse, to load any of the emulator software/programmes in either machine
code or basic eg. .atr and for example, necromancer.exe If anyone could point me to either a helpful document for help within Atari800win, I would be -very- grateful!

How about 150Mhz?

In a discussion over in comp.sys.cbm, Doug at CMD noted that Western
Design Center (creators of the 65816), have a 150Mhz 6502 core
available for incorporation into ASICs. (Meaning no discrete 150Mhz
6502 CPU is available, but you can buy the design to incorporate into,
for example, a high-speed microcontroller).

As to the RAM question, he stated such designs typically include a
small amount of very high speed Static RAM on the ASIC.

He did not mention how much WDC charges to license the 150Mhz core.

Well, some xfd and atr file seem to work and others don't. You need to disable basic - different emus have different ways of doing this - some ask you to press a key when reseting; with others you just state the xfd file on the command line without asking the emu to load basic. Try using the same files with different emus. With XL-it you need to load the files as virtual disks from the dos menu.

To be honest the best emu I've found - for ease of use and compatibility - is VSS (5200 emu.) At least you know where you stand with it - it only plays .bin files but there's a decentish list of these at dave's classics (which you probably know about anyway.) It also plays Bounty Bob Strikes Back almost perfectly.

Definitely a good thing then :)

Not seen 'Daves Classics' Cudl you post the url of it, and also where to
grab a 5200 emu? Hopefully I'll figure out to save basic files over the
next few days :)
With running non basic .xfd and .atr's does having dos in D1 help at
all? If I can get enough info on all this together I'll try and put
together a doc with step by step instructions for newbies to the
emus like me... All I want is Fort Apocalypse and Nercomancer back
(oh, and Blue Max, Rally Speedway etc etc)
The .exe files seem frustrating if you have a look at some of the stuff
(Ballblazer, Rescue on Fractalus and Mercernary) thats on them. No doubt
there are a few happy people out there in paradise who know how to run
them. With the total lack of anyone able to sell me an old 8 bit here in
the UK, emus seem my only recourse now.

> US Customs and poorly repackaged.

No one with any common sense sends things wrapped in newspaper wrapped with
strings. One can always get someone to agree with them doing something
silly. I believe you inadequately packaged them, and you were responsible
for them getting to him in one piece, solely responsible. If there is any
issue with YOUR choice of carriers, it is your responsibility to deal with
them, not the receivers. Your negligence is not his responsibility.

> Secondly, I strongly resent your suggestion that I have deliberately

No commercial software in the 20 years I have been in the computer business
has EVER been shipped without labels. Period. If they had no labels, you
should have mentioned that to the purchaser, and, apparently, you did not.

<snip>

> I certainly do not have a disk from this package here. I

> US Mail.

Once again, it was your responsibility to assure the packages got to him in one piece, not his. If anyone has to deal with the carrier, it is YOU, and only you.

> Finally, ... you consider some of the benefits of civility and politeness.

And you some common sense in adequately packaging the items and full responsibility for getting them to the buyer in one piece. You SHOULD refund monies for whatever arrived to the seller not in the state you two agreed upon, and stop shirking your responsibility!

>game.

>Gareth Davies.

Yes I was playing it the other day on an emulator, and remarkably it
is one of the few games that have realy stood the test of time. Those
ogres/rabbits running across the screen on the first level are so
cool. But the best thing about it was the sound effects.

Cheers,
Bobby Chariot.

P.S.

If you want to se it again the emulator I was using was
'atari800win_1.4.zip' A freeware Atari 8-bit computer emulator for
Win9X/NT here: http://www.cris.com/~Twist/atari800win/

You will also need to get the atari_roms.zip, there is a link on the
page.

Necromancer is available in games002.zip (595k) at
ftp://ftp.sodre.net/pub/users/cmwagner/atari8/mirrors/ftp.hackerz.com/megaimages/

also get menu.atr at the same place.

Set menu.atr as disk 1 and games002.atr as disk 2 and hit reset(F5).
Necromancer is on the third page of the menu.

The SuperVideo upgrade was printed in Atari Classics magazine.... I have
back issues available for $8, including First Class postage. This is a
lot of money for this kind of thing and I am certainly willing to have
the information freely distibuted, but to scan in all the material and
make it available is too big a project for me right now. I need to work
on the magazine itself and hacks, my true passion.

yes, I'm sure all that is possible.... but, you are working with a
completely buffered device. I did a parallel floppy interface that ran
really, really fast except when you got an interrupt and the data
overran the controller. Then you had to re-try the Read, waiting for the
data to rotate under the head again (like .2 seconds...). So you get
zzzzzz.....zzzz.....zzzzzzzz.....zzzzzzz for data transfer.
If you kill ALL the interrupts, you have no way to break into the
channel command chain other than by pressing RESET. It's a bummer.

Same problem with a really, really fast modem, I expect. Once more, you
want to be able to read the screen, don't you?

Solution is to have a second processor that shares memory space with
your Atari. Let him do all the fancy stuff - he doesn't need interrupts
or refresh or DMA stuff.

>
> Curt
> www.atari.nu
uuhhhh... it would be hard. and expensive. even a really fast processor
could not keep up with the ANTIC display list very well. you would have
to generate a custom chip in hardware to do most of the work since it
does stuff like multiple compares at microsecond rates. the easiest
upgrade is to just use two ANTICs operating together. this works pretty
good for graphics - you get 4 colors at 4 intensities at 160x160
resolution. or, you can have GR.0 screens in four or more colors. easy
to program, too! just load a graphics screen in the "B" ANTIC and then
switch to "A", using it independently. this does not do much for 80
columns, though. if it weren't for the fact that you could have not only
dynamic data on the screen, but a dynamic DL also, it would be easier. I
think on it every so often.... no solution has popped out yet.

---
naaawwwww..... the 65xx is a CISC chip! It does not have things like Multiply and such, but it is not a RISC chip. The amount of work done during each instruction IS the important criteria, but consider this: a 64 bit computer, for example, must fetch an instruction, execute the instruction and then store the result. If you are working with a byte data value, the CPU may have to first align the data, do the operation, re-align the data with the other three bytes that have not been modified, and store them all back into memory. CPU guys spent a lot of time making this process work better in machines with more than 8-bit data paths. How much time does a system spend using two byte, four byte or 8 byte data? Compilers try to use them a lot, I expect, since byte aligned data is very inefficient in these big machines.

Consider a simple printer driver: you have all your formatted text in memory.... each character with its high order bit set is to be printed in BOLD..... get the first byte... check bit 7... pull the character from a 128 byte table... send the BOLD pre-fix if necessary... send the printer code for the character...

is a 64-bit CPU going to help you here? yeah, maybe - if it has a lot of stuff in it to speed things along.... but, we have a byte operation and an 8-bit indexed fetch here.... works just fine on an 8-bit. A lot of what we do is byte data - maybe because we always had 8-bit machine and maybe because of the character oriented nature of many things we do.

oh... off my soapbox.

I might have added
poke scr+position,value
where lets say you should plot a point at 10,1 position would be 2 (10
pixels=1 byte + 2 bits)
and the value would be 64. But it would reset whatever values is in the
second byte, so you need to add what was already there. It's gonna be slow
in basic I think, but ... Why not try assembler ? I could try get you
started and I guess more assembler coders out here would help too. Take

Turbo Basic is a LOT better than regular Atari Basic, IMHO.
Sometimes I will write a quick ditty with it, but I prefer
ACTION!. it is also more handy than Basic XE, in that it can be
compiled (both Turbo Basic and Action!).

wellllll.... if you use an x86 chip as the I/O processor, you cannot use
your existing software libraries for the 65xx. One advantage to a very
high speed aux processor is the ability to point it at internal code
(like the FP routines at $D8xx) and let it do the math for you. Load the
FP regs, tell AUX to run, wait for him to finish, continue
processing..... neat? Sure would speed up BASIC.

No, the author describes it as extremely Alpha . Breaks often.
Is not for the faint-hearted. Everything I read about it
described only server functionality, nothing described any
kind of existing client software. Also, it completely
replaces the C64 OS, so it's basically an incompatible platform
at that point. i.e. You're not going to nfs mount a unix
partition on the c64 and save Paperclip files to it as if
it were a floppy disk any time soon.

Emulating the hardware accesses is _a lot_ easier when you're already doing full emulation like the ST or PC based emulators. You've already decoded everything, and very little _extra_ effort (i.e. one table lookup, and only on the instructions that actually modify memory) needs to be done to check for hardware accesses. Note also that since you are emulating the target CPU registers and status flags, the host CPU can check all this stuff without interfering with the target CPU. There's no quick way you could check for hardware accesses each instruction using the same CPU that's trying to run the code itself. The best you could probably do, is interrupt the processor every so often, and check for modified memory in RAM at the hardware addresses. That's still quite a bit of overhead, and a lot more error-prone since you would loose multiple accesses to the same location in between polling intervals. You also wouldn't detect accesses where just reading or writing the same value to a location triggers an event.

Jason was right. Without an MMU to trap addresses at a hardware level, a decent emulation on an Apple GS would be impractical.

>I have long been puzzled, however, why none of these emulators have

Today's CPU's can emulate 6502 code faster than the fastest 6502/65816 chip ever produced, so in combination with the above reasons, and costs, it doesn't really make any sense to do this.

StarCom is in regular use by a fair few people but isn't a file server,
as such. Imagine Norton Commander with a few more features and the option
to read devices 8 and 9... =-)

As for Server64, I've got a Dell 386 sitting next to one of my machines
that boots straight into it and it's pretty cool. Sadly, although it was
cardware, very few people supported it and the programmer lost interest
in the project even before it reached V1.0 but it runs *very* well and
gives a faster performance than a stock 1541 drive, barring one problem...

> It could be that neither of these solutions support common fast
> loading shemes and/or JiffyDOS, which would certainly explain part of
> their lack of popularity.

...it doesn't work on fastloaders. Okay, so if the transfer rate is
faster than a stock 1541, why do I need a fastloader? Well, mainly
because I have an Action Replay V6 present that is in constant use and
I can't have all the other features (such as the monitor) without the
fastloader turned on. As for JiffyDOS, have you ever tried installing
the ROM to a PC?! =-)

> Part of the problem in supporting such a setup on the Commodore is
> that is its serial chaining port for perhipheral...

I seem to recall that it's more a case of problems caused by the C64
having intelligent devices, our disk drives also have 6502 processors
and RAM onboard and some fastloaders store code into that RAM to speed up
communication between the two. Any tool, like Server64, that wants to
do the job *properly* has to emulate the processor as well...

It is. Read it more often.

>>>And where's your consideration of your
>>>poor C64 pals? For an entire day I didn't see you respond
>>>to the request asking how to put a C64 in the net. You

>An entire day? I'm sorry - how selfish of me. I should just
>forget about the wife, kids, job, sleeping and scan the
>all the newsgroups 24 hours a day.

Actually, I misspoke. The response to the original request was done
4 Jan 98, which means that at the time I wrote you hadn't bothered
to impart your supposedly superior wisdom on your C64 chum for more
than 4 days.

>64 Pals?, like we're a gang or something?
>Can't you just drop you confrontational, devisive attitide?

So, you're actually the one that really doesn't like C64 users? That
must be the divisive attitude you sense. Perhaps you feel guilty for
having bought the cheaper, less capable system? Are you trying to work
out your frustrations by making others gut their 6502 systems until
they have even more useless systems than your own?

>I'm not a regular poster to either group, just an occasional lurker.
>Users in each group are doing some great things, an exchange
>would be profitable to both sides. But if you represent the
>typical Atari user, there's no chance of that.

It's now been over 7 days since the original poster on c.s.cbm
asked about how to get on the net with a c64 and only one response
telling him how to dial into a provider and use the C64 as a dumb
terminal. If this is representative of how C64 users help each
other then there is nothing Atari users have to gain from the C64
camp's commitment to apathy.

[snip]

>>>" The TCP/SLIP implementation will someday be used for telneting to and
>>> from an OS/A65 computer.

>>Two big words here. Alpha means breaks often. (And I saw the

>No - really? Wow, you're smart! - can I be like you when I grow up?

No. If you can equate the TCP/IP author's clear warnings that his
TCP/IP implementation is next to useless with a fully working

network interface for a C64 then when you grow up I don't think
you'll be nearly that smart.

[snip]

>>Also, if you actually bothered reading the web pages you'd see
>>that he's completely replaced the C64 OS.

>Just like many games and languages do.

So, you're going to compare TCP/IP support to a game? You were
moaning a little while ago that I said most 6502 systems amount
to toys, since they're only hobbyist play things.

This I think typifies why the C64 users (or maybe just Noah Dial)
can't get along with the Atari users. C64 users (or just Noah Dial)
think computers should only do one thing at a time. A hack may
be proprietary and work with nothing other than the driver written
for it. A program may do whatever it wants to the system. Atari
users think hardware hacks are are supposed to extend the
capability of the existing system and software enhancements should
co-exist as peacefully as possible with other enhancements and the
OS. Maybe on the C64 ignoring the OS is OK, since there is so
little OS to ignore. But, on the Atari we expect enhancements to
be just that: an enhancement, not an incompatible replacement.
How many people would use an MIO or APE if it meant that no
existing Atari software could run while these things are in use?

>How many DOSes and BASICs are there for the Atari?

Lots, but DOS is an enhancement to the OS on the Atari, not a
replacement. And the language used doesn't replace the OS
either. The languages on the Atari depend on OS services for
graphics, I/O etc.

>>In effect, to get it to work it isn't a C64 anymore

>Really, I took ALL the Bill Gates out of my Pentium box and
>installed Linux, and guess what? It's still a Pentium.
>Imagine that.

It is no longer a a Windoze PC. Imagine that. Now try running
some useful PC program (if there is such a thing) on your intel box.
Can't do it effectively, can you? Imagine that. If you replace the
OS it is no longer the same computer. Imagine that. It's a very
simple concept that most people here understand. Except you. I'll
try to use smaller words in the future. Maybe that will help your
reading comprehension.

>>(I knew the existing computer was deficient.)

>Why are there things like SpartaDos and Indus GT drives?
>By your logic, that would make the stock Ataris defecient.

Neither thing mentioned replaces the Atari OS or is incompatible
with the stock Atari hardware. What planet do you live on that
you can mentally equate a system-compatible upgrade to a completely
incompatible OS rewrite??

By your logic, a machine running Linux and a machine running Windoze
must be the same computer capable of running the same programs at
the same time just because they have the same processor.

>>So, congratulations; you've discovered that
>>you can get a C64 on the internet if you throw away its
>>personality and make it run an OS for which there is a software
>>base of maybe a dozen programs.

>You don't don't what you're talking about. Nothing stops me from
>lifting the SLIP code out and using it as a program on the C64
>with its native OS, or using it as a program on the Atari with
>it's native OS.

Well then, if nothing is stopping you then why do you only talk about
it instead of doing it?

>SLIP is just a serial protocol, it can be ported to other OS's.

You're dreaming if you think you're going to get on the net with
just SLIP. SLIP is only a transmission protocol and is pointless
without the rest of the network support underneath it. And that
network support is a resource hungry beast. Buffering packets
would consume 64K in a fraction of a second on a fast network.

>>I guess years of Commodore introducing new computer models
>>mostly incompatible with previous computer has numbed Commodore
>>users to yet more incompatible stuff.

>Let's see PETs, CBMs, VICs, C64's, C16/+4's, 128's, C65's.

>All have compatable BASIC's even though the hardware advanced.

Not. It's not very likely that any BASIC program that uses just
one POKE (which easily describes over 90% of the CBM BASIC programs
out there, since you can't get anything practical done on them
without using the almighty POKE) is going to run on a differing
system. In theory they should have been much more compatible, but
some idiot at Commodore thought different OS jump points and
different I/O would be a smart idea. Other than a few non-POKE-ish
BASIC programs (a small fraction of the software base) these systems
are so different they might have come from different manufacturers.

And, the move from C64 to Plus4/16 can't be sanely described as
an advancement.

>Incompatabilty with a previous generation is a fact of computer life.

>The Atari hasn't really changed much since the original 800.

For one thing, since the Atari 800s started so far out in front of
other 6502s that existed (or were yet to be released) they didn't
need that much added to them for years. Also, you haven't adequately
kept up with the Atari 8-bits. You can add megabytes of RAM, SCSI
drives, etc. Things never thought of when the original Atari 800 was
created. And these things are largely compatible with years of
previously written software.

>And that's sad.

No, compatability and consistency is good. It's why today I can take
a commercial program written for an Atari 800 in 1980 and reasonably
expect it to load from a hard drive and run on an Atari XL made in 1985.

>>I imagine most Atari users expect that running TCP/IP on
>>an Atari means running it on something that still runs
>>Atari software at the same time.

>See above.

I'll just wait for you to finish the TCP/IP implementation for the
Ataris and C64s which you promised would be so simple to do.

I have the following hardware/equipment & software for sale. Please
e-mail if you are interested.

Thanks,

Jayne Bryant
jbryant@erinet.com

COMPUTER ITEMS:
FOR SALE
QTY DESCRIPTION PRICE

1 ATARI 800 COMPUTER (8 BIT) W/PWR. SUPPLY & CLOTH COVER (4 JOYSTICK & 2
CARTRIDGE SLOTS) $35.00

1 ATARI 810 DISKDRIVE $15.00

1 SUPRA 2400 BAUD MODEM W/PWR. SUPPLY $10.00

2 ATARI JOYSTICK (For 8 Bit/16 Bit) $ 5.00ea

1 ATARI XM301 MODEM W/SOFTWARE $10.00

1 CONNECT TO TV BOX (COMPUTER OR TV) $ 5.00

Operator's Manuals and Technical Reference Notes for all above equipment.
Software included: Alien Numbers, Donkey Kong, Star Raiders, Pac-Man,
Space Invaders, Math Blaster, Delta Draw, Atari Bookkeeping, Print Shop,
Atari Writer, Telelink1, ET Phone Home, Fraction Fever, Telly Turtle,
Zork, Lunar Leeper, Math Pack, Basic Language

Source record: 67158

Great game as most of the others Bill Williams did. I particularly loved
Alley Cat. Weird but innovative and very playable.

To trivia around a bit: Bill Williams also did the brilliant and completely
weird Mindwalker for the Commodore Amiga (BTW, the last game from Synapse
software - sniff) and the equally quirky Sinbad and the Throne of the Falcon
for Cinemaware (Amiga). After that I only know of two more games from him
(both Amiga): Pioneer Plague and Knights of the Crystallion. He is supposed
to be into experimental music...

Does anybody know what the man does nowadays??

Julian

Back in Sept 96, Ian himself posted a query here looking for help doing an
html version of his book. He does indeed own the rights. At the time, the
discussion devolved into bickering over alternatives to html, which some
thought was not the ideal format. I have not seen anything about it here
since then, so I don't know what became of the project, or if it even got
off the ground. If you're interested, here is Ian's e-mail address:
ichadwick@georgian.net

I think it would be a great resource.

zzyzx wrote:
>
> > I got both packages today, but I am extremely disappointed.
> >
> > 1st of all, why didn't you protect them in a cardboard box?

I definitely have to agree here - sending such poorly packaged items across the Atlantic in a ship was foolhardy. And Geoff charged Zzyzx 10 pounds for shipping?! What a rip-off. For that kind of money it seems Geoff could have gotten a box AND sent it by air. And I thought I was a cheap penny-pincher!

>
> I too am disappointed that one of your packages has arrived in poor
> condition. However, I am even more concerned by the aggressive and
> impolite tone of your message and especially by your insinuations
> about my honesty.

Sounds like a cultural issue. In the USA, people get angry when they pay good money and get poor service. I guess they behave differently in the UK. Still, I think Zzyzx was pretty restrained for the most part.

>
> Firstly, both parcels were packaged more than adequately and I

> US Customs and poorly repackaged.

Considering the cost of these parcels, Geoff REALLY should have insured them - especially since Zzyzx had forked over so much for shipping. Personally, I insure every package worth more than $50.

>
> Secondly, I strongly resent your suggestion that I have deliberately

> reputable London retailer. Home-produced adventures were often
> released on unlabelled disks and I have a number where this is the
> case.

If memory serves, Corruption and Jinxter are NOT home-produced adventures. If they were packaged in professionally printed boxes with professionally printed manuals, then I dare say they aren't home-produced. Any manufacturer, home based or otherwise, that goes through that much trouble to package their product, would certainly also put a label on their disks - even if it was produced on a simple personal printer! Seems to me Geoff should have at least assumed these may not have been original disks and informed Zzyzx of that fact.

>
> Thirdly, you say that a disk is missing from the 'Lost Treasures of
> Infocom Volume II'. I am extremely surprised by this as I
> double-checked the contents of the game box before packing it.

I can see this mistake happening, and I don't think it is much of an issue. Especially compared to other problems regarding this sale. Still, if all the original instructions were present, it would have been easy for Geoff to determine if the game had all the required materials or not.

: >computers, both Atari and not), I have been following this. From what
: >I understand, this software is still in what some would refer to as
: >"beta" form, and currently supports only SLIP, not the more common
: >PPP.

: SLIP is actually a better form of connection than TCP/IP.

This is sheer idiocy. You might as well be saying 'a tire is a better form
of transportation than a car.' SLIP and PPP are both protocols for
transporting network traffic across serial (and occasionally other) links.
TCP/IP is the protocol used in all internet traffic.
SLIP is for TCP/IP traffic only, whereas PPP can be used to transport
IPX, Appletalk, NETBIOS, etc traffic. SLIP is a kludge protocol written
over a weekend by someone, whereas PPP is a well thought-out protocol
allowing for dynamic address assignment, data compression, etc.

: A RISC PC running a slip connection generally achieves a much more stable
: connection than a windows box running tcp/ip.

This is more idiocy. The only time I've experienced problems with the
Windows TCP/IP layer is when someone has intentionally sent traffic designed
to take advantage of bugs in the network driver.

: It also allows much
: reliable sockets to be achieved than via a winsock.

Sockets by nature are either reliable (TCP) or unreliable (UDP).
This does not vary from platform to platform.

: Using an Archimedes
: with a 14.4 modem, 4 sockets are spawned to the news/mail server. As
: soon as one drops, another is connected giving what appears to be a
: continuous connection, the same for browsing.

Wintel machines are equally capable of this.

: WINSOCKs are supposed
: to achieve this but rarely do, with only one socket actually working.

I can open as many sockets as I want up to the limit (currently 64) set in
the registry. All work at the same time.

: Hence, our wonderful RISC PC on a 14.4 outperforms a pentium mmx using
: a 33.6

Hence you can continue to delude yourself that a >150 MHz machine can't keep up with a 33k baud connection.

: One in the eye for wintel methinks.

Perhaps you should check your own eye first.

Necromancer was an excellent game, the gameplay was superb and
unlike anything else I've seen. Bill Williams who wrote it also
wrote the equally wired but superb Alley Cat. However I only found
this on a US Gold budget ï¿½2.99 cassette. I managed to find to files
in an Atari 8 bit ftp site called necromancer.exe and alleycat.exe
which I assume are for an emulator (?) which I could mail you -
I haven't brought the url for the ftp site in to work unfortunately.
If anyone knows how to use these files or even run .xfd file in
either atariwin800 or xl-it let me know!

I think so. The problem with PPP is more based around the software that
uses it - I don;t think I was very clear to start off with, hence I
appear to have manged annoy one of the more -ahem- retentive of the ng:)
SLIP should in theory, be beaten by a PPP based connection everytime.
As Jason Duerstock stated in his own inimitable way, if the software
is configured correctly, by someone who knows what they are doing, then
this is the case. However a typical connection made via DUN and the
microsoft stack generally achieves a pretty poor, slow connection which
dosen't do the hardware justice.

Well, the screen is located at the address which is pointed to in $58 +
$59. To poke directly to screen, use something like this :
scr=peek(88)+peek(89)*256
poke scr,value

You have to calculate which pixels are to be poked. 8 bits pr. byte and in
hires, each bit is a pixel. In multicolor, two bits is one pixel.

Hope this helps, but you should consider getting an assembler routine. I
might be able to make one for you.

Thanks for the info. I don't know if it's possible to run .exe files on emus: all the emus I have won't run them. There's probably a simple way of doing it though - I doubt if they'ld be on ftp otherwise. Never played - or saw - Alley Cat.

SO what exactly is in an .exe file then? When you fun them on xl-it
they sound very like the sound from a 410 tape drive when loading.

Could you explain then how to run .xfd and .atr files? It all seems
very different from my old Atari 8 bit> Basic is fine, but I'm getting
very frustrated with trying to us dos etc on the emulator. Argh!

Source record: 67083

The English language version of Quick is available directly from us (DGS). It costs 12.99 UK Pounds, or US$26 plus shipping of $5 (which is per order, so if you order other things as well, the per item delivery will be cheaper). Full details are in our full catalogue, available directly from our web site: http://www.dgs.clara.net

We also have a set of Quick demos on our web site downloadable as a .ZIP file which will produce several .DCM files. This is also downloadable from the web site quoted above.

Quick has proved extremely popular in the UK and Germany (where it was originally produced), and has sold many copies in the US also. Quick is very cheap for what it does. I can't really give a review/critique because we actually sell it, but I'm sure some other users out there could provide one.

I stand corrected then, I was going by funet.fi which had two versions
of the kernal. Maybe they're not including the very first short-lived
kernal - the one where you had to press the space bar to load a tape.

Copyright is a real problem then. I don't particularly care about the legal implications - nothing is likely to be enforced anyway and considering that the book is out of print there's the moral defence: sounds pompous I know - why let such a great work be lost.? I think if Ian Chadwick is himself considering issuing the book via html then it's only common courtesy for me not to. Still, if nothing happens in the medium term I'll have a go myself perhaps altering the wording.

Well this is what happened. I saw a post on RGVC from the Dark Lord
saying he had a mint condition, complete MagiCard, Chase the Chuckwagon
and Sword Quest: Water World for trade. So I emailed him at
satan@hell.com and he said what he was looking for was trades for souls.
So we struck a bargain and I traded my soul (which is in mint condition
and has hardly ever been used) for the carts. I sent out my soul in
goodfaith and waited for him to send me the carts. Nothing came.
Luckily I send my soul registered mail so I was able to verify that
he had taken delivery of it but I still didn't get my carts.
After a month I e-mailed him and asked what was going on. He was said
he was sorry it took him so long to send the carts but he had been
rather busy with the mid-east peace proccess (screwing it up that is).
I told him that the peace proccess in the middle east looked sufficiently
screwed up to me so could he please send me the carts. "Sure thing, they'll
be in the mail first thing monday."

Well monday I get another E-mail from him saying he won't be sending out
the carts on monday as he decided to cause a Canadian Postal strike instead
and the carts wouldn't get here anyways. Well isn't that just fine.
So the strike finally ends and I E-mail him asking him to send me the carts.
I get an E-mail back saying "Sorry, I won't be able to send out the carts
as it's the christmas season right now and believe it or not it's one
of my busiest times of the year. But I'll send them out in the new year,
promise."

I'm pretty pissed off now because it's been three months since I sent him
my soul and I've yet to see my cartridges but I grit my teeth and endure.
Finally I get the carts in the mail.... WHAT A MESS!

Mint condition my ass. These carts are covered with the worst acti-plaque
I've ever seen. And you know how old 2600 carts sometimes have that
"basement smell" to them? Well you haven't smelled anything until you've
smelled Satan's basement. All the games were missing the manuals and
the worst part was instead of sending me a Sword Quest: Water World
like we had agreed upon. I recieved a Sword Quest: Fire World (go figure).
Now I was really pissed with the Lord of Evil so I sent him a flame e-mail
complaining about the trade. Not one of the items were what I was told they
would be. I demanded we trade back. Satan ignored my e-mail so I sent
another... and another... and another... and another. Finally he e-mailed
me back and said he wasn't too happy with the condition of my soul either
and that I should be happy I got anything for it, but he'd trade back.
So I pack up the carts and send them back to him, registered of course,
but now he refuses to send back my soul and he ignores all my E-mail.

So I'm just warning all of you that you might want to put Satan on your
Bad Trader Lists.

I already have that article scanned in and saved in my PC as one GIF
file per page.

Would there be any objection to me posting this article on a web page
(once I get a chance to convert it to HTML)? If that is acceptable,
give me the details on subscribing to Atari Classics, so that I can
make certain people know where to get the magazine it came from (as
well as who to thank).

> The .exe files seem frustrating if you have a look at some of the stuff
> (Ballblazer, Rescue on Fractalus and Mercernary) thats on them. No doubt
> there are a few happy people out there in paradise who know how to run
> them.

Nothing difficult about that. Just load a simple DOS (e.g. 2.5) with your
emulator (BASIC enabled of course) and then load the game with this DOS.

Example for DOS 2.5:

L (for load)
<Return>
D2:RESCUE.EXE
<Return>

Beware! Some of the files don't run from D2:. In this case you have to change
the .EXE-File to D1: like this:

L (for load)
<Return>
*
D2:RESCUE.EXE
<Return>

* means change DOS-ATR-File to .EXE-File.

Another disadvantage is, that only a few emus support .exe-Files as
"discimages". XL-it and the ugly XFormer support them.

Just wanted to remind you all that the DGS Atari 8-bit catalogues are still
available direct from our site at:

http://www.dgs.clara.net

We also have on there a list of PC CD-ROMs we are clearing. These are all
new and shrink wrapped. A list is available at the site shown above.

On a completely separate matter, anyone who works for a company with a
COBOL installation, may like to visit our other site at:

http://www.dgs.clara.net/y2k/

No, early 80's. Back then Atari were doubling revenue and income every
year prior to the crash. Income was many hundreds of millions back then
with huge profits.

> Sometimes I feel that Mr. Tramiel didn't catch up with
> the spirit of selling computers in 90's.
Atari had decided to bail out by the 90's I was told by a senior Atari
staff member that they looked at the market in 1989/90 and decided that
the PC was going to take over and the ST was dead. At that point they were
starting to look back to consoles whilst trying to pacify the users with a
few minor ST updates.

I don't think that at all. Learn to read. Never said anything even
aporaching that.
What makes you so defensive?
You can't answer my statements, so you fabricate ones that you can?

I don't day-dream about these things, I do them.
Next time you're playing Donkey Kong, think about the people
that actually program these things.

> As for the idea of being censor, you obviously think only people
> who agree with you are entitled to post. I never told you not to

No, but I expect rational answers, not reverting to grade school name
calling or brand rivalary.

> post. I told you to go post in a conference where someone cares.
> And if you don't like hearing from me you can kill-file me, but as

Pay attention sport, I said you can killfile ME if I bother you.

> long as you continue to spew your lunatic fringe idiocy on c.s.a.8bit

So because CBM and Atari share some common technology and I think an
exchange could be benifical, I'm on the "lunatic fringe?"

No, it's a matter of pearls before swine. Why are you so insecure?
What are you so afraid of?

> I'll be responding, since I actually use an Atari 8-bit.
>

Hey, so do I.

> And for the C64-ers who are going to moan about this being cross-
> posted, you may blame Noah Vail who thought the lunacy of all 6502

Don't worry, CBMers don't go ballistic when they hear another product
mentioned. If anything, they'll thank me for the entertainment that
you've provided. It's the people in the Atari newsgroup that should
be angry. Your immature, histrionic, bigoted and defensive attitude
has really cast a negative aura around Atari users.

> systems being equal should be cross-posted, so you'll have to track

When did I say that the systems were equal? When did I even state a
preference for either system? Have you actually read anything?
What color is the sky in your world?

> him down to get the newsgroups header line changed.

You can change the header line yourself, but you'd resent it if I told you how.

>
> Older model HP printers used 680x0.
>
> >I'd like to add a Blitter, Copper, Agnus.....

> Yeah, right. Insanity.

Um,.. you've heard of sarcasm haven't you? Next time I'll put it in
parethesis so it won't go over you head.

> >Maybe you've hit on something here, maybe we need a "comp.sys.65xx" -
> >a place where we can leave our brand biases at the door and
> reduce superior 6502s to the level of the neighbors' cheap knock-off and

If the C64 is a cheap knock off, why did Atari imitate the design in
later systems?

> >to the heart of soft/hardware hacking.
> Oh, yeah. And that, too.
>
> And, it is a good idea. Take gutting systems to another conference.

Oh, I see, modifing hardware is "gutting" the system.
Do you own a stock Atari with stock drives? Or has your system been gutted?

>
> >I don't think so.
>
> It is. Read it more often.

You're wrong. The CBM group does get a lot of newbie questions, but that's
because the user base is so large. When comes to 8 bit wizards, comp.sys.cbm

is unsurpassed. No brag, just fact. There's a lot of great hacking going on
in the Atari group too, but there's just too few users compared to the CBMers.

> >64 Pals?, like we're a gang or something?
> >Can't you just drop you confrontational, devisive attitide?
>
> So, you're actually the one that really doesn't like C64 users? That
> must be the divisive attitude you sense. Perhaps you feel guilty for
> having bought the cheaper, less capable system? Are you trying to work

You're not insulting me by degrading a computer product, you're just displaying
your ignorance and intolerance. Every machine has something to offer and
is special. There are things that I love about a 1k Timex/Sinclair.

> out your frustrations by making others gut their 6502 systems until
> they have even more useless systems than your own?

What frustration? I'm having the time of my life.

Again you say, "gut." I'm talking adding-on, not taking away.

>
> >No - really? Wow, you're smart! - can I be like you when I grow up?

Well, I have WINE the Windoze emulator, and DOSemu the MS-DOS emulator,
but I really have no use for them. But if I really wanted to cripple
my machine, I have run some M$ OS stuff - I used to run Paint Shop Pro
from WINE, but now I use GIMP.

> Can't do it effectively, can you? Imagine that. If you replace the

Yes, I can - but why would I want to?

> OS it is no longer the same computer. Imagine that. It's a very

Sure it is. It just works the way it was supposed to now.

Just like people replaced the inadequate Atari BASIC and DOS.

> simple concept that most people here understand. Except you. I'll

Once again, you put words in my mouth, never meant such a thing.

> By your logic, a machine running Linux and a machine running Windoze
> must be the same computer capable of running the same programs at
> the same time just because they have the same processor.

No, but I can get the GNU compiler for both OSes and complile the
same source code on both systems and then run the same programs.
Linux i386 and MS OSes share the same CPU.

> >>So, congratulations; you've discovered that

OK, I will. That was the whole point of this, Braniac.

> >SLIP is just a serial protocol, it can be ported to other OS's.
>
> You're dreaming if you think you're going to get on the net with
> just SLIP.
> SLIP is only a transmission protocol and is pointless

I know, I just told you that.

> without the rest of the network support underneath it. And that

There is nothing beneath it, Einstein, SLIP is the bottom layer, inet
applications run ON SLIP. Once you've got sockets and packets, the
rest is downhill. The RFC's and code for most IP applications
are standardized.

> network support is a resource hungry beast. Buffering packets
> would consume 64K in a fraction of a second on a fast network.

64k in a fraction of a second? Boy, that's some modem you got.
Or do you have a T1 going to your house?
I'm laughing so hard my sides are hurting.

You have no idea what I'm trying to do, do you?

>

> without using the almighty POKE) is going to run on a differing

The pokes between the C64 and C128 were identical. It was only
the VIC to 64 BASIC stuff that needed converting.
I might have to spend a half-hour editing a program, real tough.

> system. In theory they should have been much more compatible, but
> some idiot at Commodore thought different OS jump points and

Oh, so the people that programmed for CBM were by association, idiots.
Many of those people still peruse this newsgroup, I hope you get
some nice mail.

> different I/O would be a smart idea. Other than a few non-POKE-ish

> And, the move from C64 to Plus4/16 can't be sanely described as
> an advancement.

In areas, it was. It eliminated string garbage collection, allowed 60k
of programming space, and many more screen colors.
It just wasn't a market success - coulnd't compete with the 64.

>
> >Incompatabilty with a previous generation is a fact of computer life.

I used say the same thing about my Amiga 500, but the fact is, PC hardware
(tho I hate to say it) has surpassed the Amiga hardware.
Now I have an Amiga 4000, but what good is a 40 Mhz 68040 if the blitter
still runs a 8Mhz?

When the C64 was first released it had some hardware advantages over
Atari. But the Atari still had advantages over the C64.
Who cares? Life's too short.

> need that much added to them for years. Also, you haven't adequately

Same as th C64, so? There are things both side can learn from each
other. Are you so full of bile and hatred?

You remind me a someone dying on a battlefield because he refuses to
take a blood transfusion from a man of a different race.

> >And that's sad.

Really?, I have a number of 800 disks and carts that my xl chokes on.

The C64 had one ROM revision, can the 800 series say that?

> >>I imagine most Atari users expect that running TCP/IP on

Well, I think he just deleted the messages on his own computer...

>I do not believe this is a moderated group, and as such, deleting posts
>that are not your own is something someone should not be doing.

No, it isn't a moderated group and you're certainly right...
But it is in fact trivially easy, to cancel (delete on all newsservers
that support cancels) other people's posts. This practise involves
forging headers and is generally despised by the Usenet community (so
NEVER do it, even if you know how to do it. It WILL be noticed, the
deleted article will be reposted and you'll most probably lose your
account!).

But there are certain circumstances, when the removal (cancel) of
posts is permitted. These circumstances are outlined in an FAQ
regularly posted in news.admin.net-abuse.bulletins (among other
places).

>It should NOT be up to one individual (or a few individuals) to determine what it is
>that gets posted in this news group.

That's certainly true, but what most people don't know or realize is,
that Usenet as a whole has been on siege for some years...
People called "Spammers" are posting messages advertising Web-Pages
(most of the time porn related) or whatever over and over again to
many unrelated Newsgroups (often thousands of them). Since those
people began some years ago the problem got so bad (this "Spam" makes
up about 30-40% of the whole news traffic nowadays), that rules have
been devised describing what constitutes "Spamming" (this procedure
involves counting how often identical messages have been posted during
a certain time interval; a certain number, the so-called BI is
calculated). Some system administrators have then set up so-called
cancel-bots, which issue cancels for every identical article posted
too many times.
"Spam" is one of the circumstances, where canceling other peoples'
posts is permitted.

So it could be that those messages you observed disappearing were in
fact "Spam" or large binaries (binaries in non-binary groups is
another circumstance where cancelling is permitted to a certain
extent) and therefore were automatically cancelled by the bots.

Noah> The C64 had one ROM revision, can the 800 series say that?

You both make good points, but this one is clearly wrong. The C64 had one BASIC ROM revision, but I have come across two different character set ROMs (not counting hacked and nationalized versions) and three different versions of the KERNAL ROM (again not counting 3rd party upgrades and nationalized versions, and not even the SX-64, Educator 64 or the C65, which all had slightly different ROMs).

I think that the lack of a decent OS in the C64 was both a good and a bad thing. A good thing, because people had to learn machine language, as the BASIC was so poor. A bad thing, because you are forced to use fastloaders and other things that are not compatible with all software (because everyone tried to bypass the KERNAL in some way).

Then there's also the problem (common for both Atari and Commodore) that the 6502 has only three 8-bit registers, a totally unorthogonal instruction set and only 16-bit addresses, which makes it very difficult to write good compilers for it. The Z80 people have had it much easier. Does anyone know if there is a *decent* C compiler for the Spectrum available? (I know of Small C for the 6502, but I think that it produces far too inefficient code.)

Noah> Please don't stop posting, I'm really enjoying this.

Me too. :-)

>Atari 8-bits in a system-friendly manner without reducing them to
>useless 6502s with 64K of RAM. To quote some pop culture: "Prove it,
>pretzel boy."

Noah might try to cop-out and write some really clever [heh]
counting loops that will run on both computers without
modification. But what's the point of trying to involve the
entire Atari 8-bit and C64 communities in programming that
nobody cares about, Noah?

Maybe Noah might find one or two people who want to help calculate
pi on the 6502. What Noah didn't seem to think about is that
90% (probably more) of the programs everyone uses on both platforms
involve some kind of graphics and/or sound and/or I/O.

Start with graphics, Noah. I'll even suggest some easy requirments.
You don't have to think about sprites, fine scrolling, mixed display
lists, redefined character sets, or DLIs. Just deal with a plain
screen of uniform graphics.

Now, Noah, what you seem to be totally ignorant of is that the
Atari's ANTIC has 14 display modes which multiplied by GTIA's 4 color
interpretations comes out to 56 unique graphics displays. Granted,
some aren't as useful as others, but then again, you are not the god
of 8-bits that you can dictate to Atari users what kind of graphics
they are allowed to operate.

Now, you have a generous amount of time to figure out how you're going to get Atari 6502 code using any of the possible graphics modes to run on the C64 with similar results and [quote] only minor modifications. [unquote]

This should be really, really fun.

You must be some kind of closet racist yourself trying to project
your sins on others with your puerile racist insinuations that
have no place in any discussion, including here.

Given your seeming omniscience you must realize that this "brand-
bigot" as you have labelled me was persona non grata by ANALOG
computing magazine in its waning days. (Especially with that
guy who ran the End User column.) I mailed them just about every
month to harp on them for being all gangbusters for the Amiga before
Jack Tramiel bought Atari and then doing complete 180s when the
inferior ST was released.

You should also be apparently aware that I have three Atari 8-bits
and four Amigas ranging from a stock 2000 up to a machine with
128M RAM, 2G hard drive, and a graphics card.

So, stuff that in your bigot-pipe and smoke it.

>> Noah says:

Congratulations Mr. Gates. Have you really thought about
where that is going??? You've discovered Microsoft
Principle #1 for Making Users Frustrated: Reduce performance
by adding yet another layer of API. You have graduated
and may now happily re-install Windows 95 on your PC.

And, your vision of serial I/O on the computers would probably
prevent high-speed I/O from working on the Atari. Thank you
for gutting high-performance I/O from the Atari in the name
of compatability. I know we all appreciate it immensely.

>Hardly "useless 6502's with 64K of RAM"
>A ML sort routine, memory move, math libraries, etc., work the
>same on any 6502.

Because at that level it is just a 6502 with RAM. Duh, that
point stuck you right between the eyes and you're too dull to
feel the pain. Oooo, lets move some memory here. oooo, lets
move it over there. Oooo, this is so "useful". ha ha ha.
You're funny.

Yup. I figured you'd come up with some non-intensive routines
as an example of your supremely unparalleled thinking. Only
background support stuff. Just wait till you get to the stuff
that the majority of 8-bit users code for: graphics and sound.
That will be really funny.

I can't wait to hear you tell Bill Kendrick that he's not allowed
to use DLIs and 60hz page flipping anymore.

I'll be back in two days. Tell me what Bill says.

No, some of my best friends are closets. I have no sins to project,
I love Apple, Atari, CBM, CoCo's, Amiga's, Pentium's, Macs, etc.
I've never seen a Spectrum, but I'll bet I'd love them too.

You're the one who's filled with hate and bitterness for a machine.
Gee, chuckles, can't you come up with anything else besides the ol'
'I'm rubber and you're glue' routine?

> Given your seeming omniscience you must realize that this "brand-
> bigot" as you have labelled me was persona non grata by ANALOG

> guy who ran the End User column.) I mailed them just about every

I'm sure you've offended many people over the years, doesn't suprise me.
Another nut-ball harrassing a magazine with letters because they reversed
their position on a computer product. Sheeessh, don't you have a life?

> month to harp on them for being all gangbusters for the Amiga before
> Jack Tramiel bought Atari and then doing complete 180s when the

> 128M RAM, 2G hard drive, and a graphics card.

Well, I'm a big Jay Minor fan too.

Well, let's see, I've lost count of my 500's, sold my 600, I'm useing
my CD32 as part of my stereo, I have a 3000 Tower in the bedroom and
I use a 4000/40 at work. So am I supposed to be impressed?

You don't even want know what I've got for 8 bit machines, I keep telling
my wife, "Don't worry, these'll all be worth something some day."

We'll probably agree that the Amiga was the best home computer of
the 80's, but that doesn't mean I gonna trash someone cause they're
running Windows 95 and programming in Visual Basic.

> So, stuff that in your bigot-pipe and smoke it.

Clever, make that up yourself? OK, I'll just call you a Chauvanist Pig.

>
> >And I meant it in the broad sense,

Aww, shucks, lil' 'ol me???

Ok, tell you what, I prefer PPP, I'll write that - will you eat
every page of source code when I finish? It'd be something nice
to have on video tape.

No, I'm pedaling forward, why would I want to work on a project
someone else is doing? No, I'll do PPP instead, it's what most ISP's
prefer anyways. Bon appetite!

(Snipping all the BS about me being afraid to write a SLIP protocol....)

>
> So, trying to offer yet another hopelessly lame excuse why you
> can't use his SLIP code like you said you could?

McFlyy?!?! (SLAP,SLAP) anyone in there? I said I would use his SLIP
code to write inet apps. Aren't you listing?

Now what are YOU gonna do, Peewee? Put up or shut up. I can picture
you around your Amiga, making musical farts with your SAS/C compilier.

If I searched the Atari archives I'll bet I wouldn't see amy of your code.

Come on guys!

1.) This discussion is about a computing hobby. Not about some religious dogma. Nor does either one of you own $50,000 to the other guy. Or did kill the other guy's wife. Or anything _serious_! You call this dedication? I call it being ridiculous and making fools of yourselves.

2.) Need to vent hate? Watch some Zombie movies instead of clogging up this group.

3.) Read the current "Amstrad vs Commodore" thread to see how this discussion could be handled (namely, like it's customary among civilized people.)

4.) Get a life.

5.) SHUT the hell UP!

6.) Rent a Space Shuttle, go fight each other on the moon, unlike this group it's UNINHABITED! (Thanks to H. Groenemeyer for this line.)

7.) Don't even _think_ about mailing/posting about how I don't know what I'm saying, 'cause it's of course all the other guys fault.

Thanks for your attention.

>
> People corrected you on graphics, sound, I/O, etc.
> Get back to your delusions:

No one corrected me, I stated the stock Atari screen size, then someone
mentioned that you get get a larger size with screen hacks, it's a moot
point since you can hack the 64's screen for overscan too.
No one corrected an error, they just stated opinions, e.g., the SID
sounds
tinny, Atari has a faster clock, etc. Stuff I never mentioned in the
first
place. You don't actually believe this stuff yourself do you?
Poor sick dufas. I notice you can never quote examples of your
falsehoods.
You only quote me to imply that I'm lying. You invent a crime and then
convict
me as guilty. I sure hope you're doing this as an amusement here, and
that
you're not really serious.

> and may now happily re-install Windows 95 on your PC.

Really? Mr Gates would be laughing his rich ass off at you.
Even he's not crooked enough to label a serial driver as a layer of API.
In fact, these routines are so simple, I wouldn't even call them
a driver.

I swore I wouldn't laugh this time, but really - man! A serial driver
is a "layer of API." Haaheeha! Better write 4 or 5 DLLs for that.

Atari's OS is much more of an API than the C64's simple kernal Jump
Table,
better trade-up to a C64 right away!

By the way, throw away your Amiga's, you wouldn't be want to be
using real API's like "Intuition" now, would you? Pinhead.

> And, your vision of serial I/O on the computers would probably
> prevent high-speed I/O from working on the Atari. Thank you

That's the whole point of a driver, oh thick skulled one.

> for gutting high-performance I/O from the Atari in the name

Boy, you really like to say "gutting."

> of compatability. I know we all appreciate it immensely.

You probably never will, being an obstinent crackpot, but
I'm sure the rest of the 6502 community will.

> move it over there. Oooo, this is so "useful". ha ha ha.
> You're funny.

No, I was refering to the routines that are already done in the
6502 library. And these routines are usefull, maybe if you'd
actually used one, you'd know that.

> Yup. I figured you'd come up with some non-intensive routines
> as an example of your supremely unparalleled thinking. Only

I didn't come up with these, they're already in the library.
You didn't figure anything. You've YET to figure anything.

> background support stuff. Just wait till you get to the stuff
> that the majority of 8-bit users code for: graphics and sound.
> That will be really funny.

I already have that stuff, at least on the C64 and CoCo, big deal,
if I want stunning graphics I'll go with a 2meg video card.

The idea is to push the machine to where it hasn't been before,
video and sound have been done to death on 8 bits, if I see another
scrolling demo I'll vomit.

> I can't wait to hear you tell Bill Kendrick that he's not allowed
> to use DLIs and 60hz page flipping anymore.

Gee, now you're putting words in my mouth in the future tense.

> I'll be back in two days. Tell me what Bill says.

> http://www.atari.nu
----
now you got me doodling around with the ANTIC..... :)

ya know, you could just maybe make an adaptor that replaced GTIA, not
ANTIC. To hook into a VGA monitor, you need to scan the screen into a
memory array, while reading it out into the VGA monitor. Using one of
these VGA adaptors just turns your really great VGA monitor into a TV.
You want to turn your Tvideo into VGA! So, you write the Atari screen
into a memory array. At the same time, you read that same array data out
into the VGA monitor - this is not a synchronized operation - the VGA
data is read at 4x the Atari screen data. The Atari screen will be 1/4
of the VGA screen, but it will look just like extremely sharp Atari
screens.

yeah, so?

well,,, if you tell ANTIC to output data using a second DL (which points
to a second data source) AND you store this second screen in a different
section of the VGA memory array, you will see two Atari screens on you
VGA monitor....

now, do a third Atari screen

and a fourth....

you now have four Atari screens on your VGA monitor all at the same time
- not overlapped, but side by side and one above the other.

suppose these four screens were 80 column GR.0 screens - you know, where
you would do horizontal scrolling...

the VGA screen would display an 80x48 GR.0 screen! The characters would be just like the normal 8x8 Atari characters... you could use alternate character sets as you normally would... it would not take too much fooling around with the E: handler... ALL the other Atari modes would also work (P/M would be hard, but...)...

The Atari would just swap DLs at every VBI. Unlike the flicker you get when you try that on the Atari, the refresh rate on the VGA will still be 60hz. The frame rate would be 15hz, which isn't too bad (it would take 4 times as long to update the data on a frame).

You could also just display a small Atari screen with no fiddling in the Atari.

this actually may not be too hard to do. you would have VGA (real VGA) and 80 columns (and 16 color 160x160, and four color 320x320, and two color 640x640, and...)

I don't have time for this....

Howdy,

Im looking for some BBS software for the
atari 8bit. I have a 130xe with 8 1050's (if
I can figure out if it is ossible to put 8
1050's, I've heard rumors of hardware mod for
4 drives to address them higher). However,

I not only need bbs software, It would help if
I could use a 850 interface, and instead of
waiting for a RING or CONNECT, the bbs software
runs @ 9600 bps, and starts when the DTR line
goes high.

This is for a non profit venture. :-)
Someone might realize what I'm doing.

>> >>What's the frequency Kenneth Jennings wrote:

I had written a huge, huge reply and then I started to realize that
it didn't matter, what is the point of replying to the sort of person
who resorts to racist insinuations and hasn't bothered to listen to all
the other people who have demonstrated the errors of his bizarre views?

But just so we understand the type of person Noah is here's just one
little thing:

Noah says:

>>>Nothing stops me from lifting the SLIP code out and using it as
>>>a program on the C64 with its native OS, or using it as a program
>>>on the Atari with it's native OS.

>>Well then, if nothing is stopping you then why do you only talk about
>>it instead of doing it?

>OK, I will. That was the whole point of this, Braniac.

So, Noah thinks adding SLIP-TCP/IP to our favorite 8-bits is just a
plug-and-play operation and also promises he will do so. But, in a
few more lines....

>>>>I imagine most Atari users expect that running TCP/IP on
>>>>an Atari means running it on something that still runs
>>>>Atari software at the same time.

>>>See above.

>> I'll just wait for you to finish the TCP/IP implementation for the
>> Ataris and C64s which you promised would be so simple to do.

>No, I'll wait for Andre to finish SLIP stuff and then I'll start
>porting inet applications.

Now Noah recants his promise (or is it just his ability?) to easily
add SLIP in a system-friendly way to the C64 and Atari 8-bits. In
past posts SLIP was supposed to be a real thing demonstrated as
working. It was all going to be so simple for Noah to port, now he
has to wait for someone else to finish doing the work for him, work

which is supposedly already demonstrated as working. Imagine that.
Noah demonstrates he is a person with no scruples, no minimum
standards, and thinks nothing of ignoring his promises.

One might also wonder that if getting a system-friendly TCP/IP
working on a C64 was so easy that Andre would have done it instead
of replacing the OS with something incompatible?

In summary of Noah's parting words above: he is just another coding
wannabe with a big mouth and bigger delusions who has publically
branded himself a liar.

But, let's get back to Noah's original fantasies, refuted by many
others, that started this all:

"If you look at every 8-bit computer every made the Atari 800/C=64
are the closest related machines of all time."
"...these machines have so much in common..."
"The same code runs on both machines with only minor modifications."
"The 800xl and c64 are closely related brothers..."

So, Noah, here's your opportunity to redeem yourself or show yourself
the fool. Explain how in your infitessimal estimation you're going to
get identical 6502 code running with similar results on the C64 and
Atari 8-bits in a system-friendly manner without reducing them to
useless 6502s with 64K of RAM. To quote some pop culture: "Prove it,
pretzel boy."

I think that at the time I opened the /pub/cbm/firmware collection
there, I already had all three revisions of the 901227 KERNAL ROM.

Noah> Maybe they're not including the very first short-lived kernal -
Noah> the one where you had to press the space bar to load a tape.

Never heard of that. Or is this some continuation to the "Young
programmers" thread?

The 901227-01 is rare enough; it doesn't detect PAL/NTSC, and its
RS-232 tables assume a clock frequency of exactly 1MHz. Maybe there
existed such a prototype; at least the UltiMax machine ran at exactly
1MHz (it had a separate crystal for the color subcarrier frequency).

Source record: 67109

> if there was a 3.5" disk drive it would solve all our problems we could

Yes, there does an 3.5" disk drive exist. To be honest there are several
different 3.5" disk drives available for the 8 Bit.
Two of them are solutions for 720KB drives and one is for 1.44MB drives.
Unfortunately the last solution isn't available at the moment because a
necessary chip isn't produced any longer. :-(The schematics are in the pd.

From Bob Puff you can get an extension for your XF551 disc drive that you can
install an extra 720KB drive so you have both an 5.25" and 3.5" connected to
your XF.

Here in germany there is a solution that replaces the 5.25" drive with a 3.5"
drive. No soldering required. I guess it is the right decision to use this kit
for all of you who have a XF551 where the 5.25" mechanism is out of order.

Jeff,
There is a great little project book called "Your Atari Comes Alive" by Richard Leinecker and David Burd. It has all sorts of things you can build. One of them is a light pen. The circuit is pretty simple. One chip (LM339 quad comparitor), 1 1.2K ohm resistor, 1 12K ohm resistor, 1 33K ohm resistor, 1 Phototransistor (OP802) and an old pen /tube large enough to fit this stuff or only the phototransistor with the rest in a box farther down the cable. Oh yeah, a db9f connector and cover.
OP802 Collector pin to DB9F pin 7 and LM339 pin 3 and one end of the 12K resistor. The other end of that resistor to LM339 pin 5 and one end of the 1.2K resistor. The other end of the 1.2K resistor to LM339 pin 12. OP808 Emitter pin to LM339 pin 4 and one end of the 33K resistor. The other end of the 33K resistor to ground (DB9F pin 8) and to the ground pin og the LM339. LM339 pin2 to db9f pins 1 and 6. DB9F pin 7 to Vcc (+Volts) pin on the LM339. Insert the work in a tube and try it out with a program that uses a light pen. The book has a program you can code in BASIC. You can also ass a normally open push button between DB9F pin 8 (one side of the switch and db9F pin 5 (trigger).
Pretty easy, huh.
BTW, B&C Computervisions has this book with program disk at www.myatari.com. Good stuff here. These are the thing that make having an Atari 8-bit fun!!!

Gareth,
Try e-mailing Ian to see if he's doing anything. Obviously he hasn't
been lurking here in a long while. I think he got disgusted by all the
noise about in which format to offer it. I think there were about 10
different format arguments raging a little over a year ago. My thoughts,
just pick one and let everyone else deal with it in their own way. Heck,
even if he offered it al in straight ascii, at least the document would
be available. Anyway, give him a chance to respond since he did express
interest and does own the rights.

>connection than a windows box running tcp/ip. It also allows much

When you state this, you obviously don't know what you're talking about.
Your windows box connection might be instable, but that has _nothing_
to do with the protocols involved but with the OS. SLIP is nearly a
raw stream of bytes (see RFC1055) with no error correction or whatsoever.
Even IP is more complicated. But probably, when your RISC PC runs a SLIP
connection, as you say, it runs TCP/IP on top of SLIP, like common
networks run it on top of ethernet. When a windos box connects to its
provider, it doesn't run TCP/IP over a raw modemline. It uses SLIP or
PPP as an underlying layer. Conclusion: saying that SLIP is better and
more reliable/stable than TCP/IP is like comparing apples and pears.
(Dutch saying).

483. Re: Mr. Tramiel

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-13 00:00:00 UTC
From: Curt Vendel <webmaster@atari.nu>
Message-ID: <34BB9F2D.2CDE394D@atari.nu>
Source record: 67121

Thomas,

You have some good points and bad points and your opinions are certainly right and wrong. Tramiel wanted nothing to do with video games when he took over the business, BIG mistake cause he had already finished and ready to go out the door 7800's on the shelves and lost the video game business to the big 3 from Japan, he did NOTHING, and I mean NOTHING with the 8-bit whatsoever: the 130XE? It was the prototype Atari 800XLF dressed in that UGLY grey plastic case with the worst keyboard ever, the XF551 came from a dreivative of the 1055 3.5" disk drive prototype, he scraped the 1090XL expansio system which would have brought in a lot of 3rd party development cards (heck originally he didn't even want the ECI bus on the 130XE and was going to close the box up completely to cut even more costs!!!), nothing was done for the 8-bit except for the XEP80 which was a total joke!

Then come the ST's... Rushed out the door (same as the Jaguar) with a lot of technology missing (Blitter and TOS in ROM), then we see a succession of ST models with tiny little enhancements here and there, but nothing significant. More importantly no real expansion for the systems (doesn't ANYBODY pay attention to the success of the Apple][and the IBM PC, it was because of SLOTS!!!!! for 3rd party development, nobody learns, too busy trying to look ahead to pay attention to what was successful in the past)

The the Jaguar, a good piece of hardware which "IF" it had been delayed 6 more months or even a year (Atari still had a 2 year lead over everyone else and could have spent that time super hyping it like Nintendo did with its N64) and released it with proper development tools and more onboard memory and cache, had the CD players ready to go and had the modems ready to go, but no... another RUSHED project with a lot of potential if they could have waited a bit longer to refine it.

Then the icing on the cake, Sam Tramiel, the only one who gave a damn about Atari has a heart attack, so what happens... good 'ol Jack (the ripper) steps back in and says ok, lets sell to JTS so his stock can go down to .22 cents a share and the bridge loan gets squandered and Atari is sold off like pieces of cake sliced and diced and handed out all over the place.

The Tramiels sucked!!! Phillips should have bought Atari when they had the chance, the Tramiels were just cheap bastards who rushed everything half-assed out the door and never advertised to save their ass.

Hmmm,

Ok, so we can't mod the ANTIC??? How about using the Bit-3 80 column card mechanism, basically we pipe the composite video into an internal daughter card with circuitry to generate higher resultion graphics via memory peeks to bitmaps and by executing a USR command like the Bit-3, the card and its graphic processor would become accessible and the composite video being piped through would be cut-off and the 2nd video processor would kick in, possibility?

This kind of stuff makes me want to stay out of the buy/sell Atari 8bit
market or any market. I consider myself lucky that after about 10
transactions I have never encountered a problem.

And I side with the buyer in this case. It seems like the seller is more
concerned with "future" sales than doing the right thing and making
present sales honest.

Also, the buyer is doing everyone a favour by posting "problem" sales.
even if his situation cannot be resolved, he can at least educate the
buying public.

Perhaps there should be a little buyer/seller code posted in each Usenet
computer base. Check out the seller by asking for references or
something. Of course the seller could make these up, but at least you

could try to do something to protect yourself. Registered mail is always a good idea too. The big issue here is unless you bought a big ticket item, is all the headaches worth $10? or whatever you paid for the item? Then again when the stakes get higher, it's much harder to walk away.

The honour system that most of us use in the comp.sys.atari.8bit base (and other bases) works fine as long as people are honest.

489. Re: Atari vs CBM - Why?

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-13 00:00:00 UTC
From: Curt Vendel <webmaster@atari.nu>
Message-ID: <34BBAF5E.A98745A1@atari.nu>
Source record: 67127

Actually,

If I had to choose an 8bit system based on its looks, I would have
gone for the C64 II, C128 or 128D, the XE and ST cases were absolutely
butt ugly, Tramiel definitely brought his lack of taste with him when he
left Commodore and went to Atari. The Mega's were ok, not great, the
Mega STE/TT030 case was different but still a little on the stupid side,
the only case that looked great was the unrelease Falcon Microbox which
looked very similar to an HP Unix Workstation (like the Hp 3000/715's)
The monitors were butt ugly too, the only good looking one was the
SC1435, thats about it. I hated those ugly cases Tramiel used. I
wish he had stay with the XL look, the design was clean and high-tech,
the XE/ST just looked cheap. (You get what you pay for)

Curt

Huge, huge? Yeah, and after all that typing you just decided to scrap it
and send this weak whining instead. ok, fine.

> it didn't matter, what is the point of replying to the sort of person

Of course, why reply to what I actually said, just take all my sentences
out of context, twist them around and reply to that.

> who resorts to racist insinuations and hasn't bothered to listen to all

You are a racist when it comes to computers, you are actually filled with
hatred for a machine. I mean, most 17 years olds eventually get over
this attitiude once they've seen more than one brand of computer.

> the other people who have demonstrated the errors of his bizarre views?

Umm.. .what other people? What bizzarre views? I've only recieved positive
comments and email, you're the only one having problems. Are you rallying
support from non-existant posts. Be careful here, you seem to be on the verge
of springing a sprocket. You're not even coherent anymore.

> few more lines....

Where did I say it was plug & play? And I meant it in the broad sense,
that I would be building inet aps on top of a SLIP stack that someone else
was working on. You're really reaching here, is this the best you can do?
Why should I start on SLIP code, wwhen much of the work has already been
done. You knew that I meant IP coding in a general sense, yet you distort
this and display it as the "great lie." Most people aren't that gullible,
but it is amusing to watch you try.

>
> >No, I'll wait for Andre to finish SLIP stuff and then I'll start

> Noah demonstrates he is a person with no scruples, no minimum
> standards, and thinks nothing of ignoring his promises.

Again you show you're amazing ignorance and lack of understanding.
Now you're really reaching, C'mon Kenny, you can do better than this -
I'm disappointed in you. Branding me a criminal, because I'm going to
write inet aps instead of the SLIP code - get real.
This is the first time I've been called unscrupulous for offering
public domain code. You crack me up - I haven't had so much fun since
I argued with a kid who insisted that Windoze 3.11 was a multitasking
operating system.

So, continue to ignore the facts, put words in my mouth, take paragraphs
out of context, search for grammatical inconsistensies, etc.
Anyone following this can observe your transparent desperation.

> One might also wonder that if getting a system-friendly TCP/IP
> working on a C64 was so easy that Andre would have done it instead
> of replacing the OS with something incompatible?

The OS started on a home-built computer for a friend. He then took
it to the next level. Andre's created a true OS that's portable to
any 6502 system. The idea wasn't to replace the 64 OS in particular
nor was the main objective the SLIP code.

> In summary of Noah's parting words above: he is just another coding

What parting words? I'm really having fun now. You can't be a real person right?
This is a bunch of school kids pulling my chain, right? You can't be for real.

> wannabe with a big mouth and bigger delusions who has publically
> branded himself a liar.

Oh, the shame, I'll have to tell my boss to fire me - after all, they're
giving me all this money to be a Sr. Programmer/Analyst.

> --
>
> But, let's get back to Noah's original fantasies, refuted by many
> others, that started this all:

Fantasies? I didn't say anything about Sandra Bullock.

Let's see, one person said the 64 had 3 ROM versions when I thought it
had 2. Hmmm, how this equates to a refutation, even after I admitted my
mistake, or how this equals "many others" is beyond me.
The only negative response I've gotten is from you.
So, how many is many? One? Two? Three?

> "If you look at every 8-bit computer every made the Atari 800/C=64
> are the closest related machines of all time."
> "...these machines have so much in common..."
> "The same code runs on both machines with only minor modifications."
> "The 800xl and c64 are closely related brothers..."

Yes, they are. This only angers brand bigots like you who don't
have the vision to see beyond their own hardware. Many people
on these newsgroups own both machines, and yes, they have their
preferences as to what is the better machine. So what.
We can all learn something.

> So, Noah, here's your opportunity to redeem yourself or show yourself
> the fool. Explain how in your infitessimal estimation you're going to
> get identical 6502 code running with similar results on the C64 and
> Atari 8-bits in a system-friendly manner without reducing them to
> useless 6502s with 64K of RAM. To quote some pop culture: "Prove it,
> pretzel boy."

It's been proven many times over. Magazines that would publish source
code, would have versions for Apple, Atari and C64 for the same program.
If the author of the article could port his program to three different
machines in time for publication, if ONE guy can do this, imagine what
a dedicated group of 6502 programmers could do.
Wouldn't it be great to see the same USENET cooperation that made Linux
a reality? How many people called Linus a "dreamer" for wanted to write
his own UNIX style kernel?

Andre made his OS/A65 hardware independant. Each different 6502 box
would have it's own serial driver and the SLIP code would talk to that driver.

So in a very few bytes, you'd have very simple routines that the SLIP
code would call. That is,

....JSR OpenSer
....JSR SendSerByte

....JSR GetSerByte
....JSR GetSerError
....JSR CloseSer

Hardly "useless 6502's with 64K of RAM"

A ML sort routine, memory move, math libraries, etc., work the same on any 6502.

So instead of turning this into a pointless, hardware debate, why not
work towards the goals of improving our platforms? You have you got
against 6502 fans working together?

I am not to proud to admit that's there's always something new to learn.

N.V.

491. You gotta love backward compatibility

For a joke I hooked up my Xf551 drive to an ancient 16k Atari 400. And beleive it or not I actually got dos 2.5 to load up.. only about 5k free of ram but a 1987-1988 8bit floppy drive actually worked on a 1980-81 Atari machine. Incredible.

There was some talk about backward compatibility simply being impossible as a matter of technology evolving. I disagree.. i think it's more for the manufacturers to make more money. If they release incompatible hardware, you have to doa complete upgrade (i.e. spend more moneyt on their products!) It benefits the consumer to have backward compatibility (and also the product lives longer!)

>I also think an addition or two to the XE hardware would have bought
>that system some time.

I don't know.
I know the XL/XE is a great machine, but Tramiel had to put
all his efforts on the ST. IMHO the right choice.
Same with Commodore's C=65. Why should anybody
release a machine if you can earn more with a new
machine? Why taking this risk? Would you?
The C=128 is a good example. It was a great 8-Bit-machine,
but nobody cared, because there were the ST and the Amiga.
I think that's a shame, but that's just buisness.
So you can't blame Tramiel for that.

Ke> pi on the 6502. What Noah didn't seem to think about is that
Ke> 90% (probably more) of the programs everyone uses on both platforms
Ke> involve some kind of graphics and/or sound and/or I/O.

Right.
Come to think of it, why dow we need cross platform code anyway?
I only want code which runs on an Atari. Who care about those other
machines? Writing SLIP code which can be used by all 6502's?
Don't make me laugh ok? Why access the Internet with an XL/XE?
Are we still on the same planet or what? 99.999% of all Internet
users use a PC, because it's cheap, there is Internet software for it,
IP providers support it, etc. Even if one would have a SLIP connection
with his XL/XE or other 6502 based machine, then what?
Write a newsreader (that is fun), or a Netscape clone?, or an
Email program like Eudorea? Yeah, right, make my day.
Accessing 100 KB+ webpages, saving it to floppy (?), and then
access that page real sssssllllloooooowwwwww. Isn't that fun.

Here in the Netherlands there was something called Basicode.
The Basic programs (because every computer shares some Basic syntax code),
were transmitted over the radio, and people could "download" it that way.
Didn't catch on by the way. At least not in my oppinion.
Look at Java at this moment. Even this language has it problems.

If a real programmer wants to write a program, he wants to take his
machine to the limit, use all available opcodes, subroutines, features,
and make use of all the peripherals he can lay his hand on.
No crappy upcode limits or whatever...
Once again, this is my humble oppinion.
Can we go back to Atari matters now?

Bo.

To a certain point a agree, to a major point I disagree.
Let's face it, compatibility, ok, but for how long?
Does your car supports steam? Does your new record player supports
every type of record ever produced? No, I didn't think so.
At some point you have to elimate old "code".
Of course it is done also to prevent the company from having to
support that old legacy code. Now there is Windows 95, it runs most
3.11 stuff, so why support that "old" windows. Makes common sense.
We've got DOS 2.5, it's better than 1.0, so why still support 1.0
By the way the OS of the new 800 XL/XE IS different than of the old 800.
That's why there are translator disks.

Compatibility? Yes, to some extend. For ever? No, thank you.
There is alway something called "emulation"...

Bo.

Another lonely voice loves Atari800win but is having trouble...

I installed this quite wonderful program on my brand-spanking-new Win95 machine and played many exciting games of Jumpman before I tried to bring back the menu (I was playing in 300x200 mode). I hit a key combination DirectX or the emulator didn't like and now when I try to launch Atari800win my system freezes to the point of needing a reset-switch reboot.

I re-downloaded and re-installed Atari800win and DirectX 5.0 and 5.0a, to no avail. Author or anybody else with an idea, please throw me a line...

yeah, an FPGA would do it.... the specs wouldn't be too hard since the
behavior of the chip is pretty well known. If you had the logic
diagrams, though, you could just 'pour' them into the gate array!
Actually, while you're at it, I would revise ANTIC anyway... no refresh,
dual port memory access, new VGA modes (still backwards compatible),
stuff like that.

I agree, this seems more about "who's right" rather than which computer is
better now....

Now if it was still about how that Atari kicks the commie in the butt, I would
love to continue reading!

There was a 3.5-inch drive made for the Atari. Amdek made a dual-disk
drive for the Atari and other 8-bits when the 3.5 disks first came
out, but I don't know what the model was.

I'm surprised no one on here remembered this or owns one.

James,

Is the 44meg drive the same as the SYQUEST SQ555 SCSI 44MB
REMOVABLE CARTRIDGE DRIVE? If so, do you need an external power
supply?

Also, if this IS what you are looking for...let me know, because I will
buy one if they work with the MIO. They are forsale by ALLTRONICS, you
can see their web page: http://www.alltronics.com/computer.htm.
Scroll halfway down the page. They are $9.95.

I have no idea how reputable Alltronics is though.

Please get back to me on this because I am interested too!

Thanks,

Cyrus

First off, try to get Mapping the Atari :-) It's the best book on the 8-bit. Also there was posted here (I think) some chapters from De Re Atari, which is also a good book.

Then maybe Compute!'s first (preferably) second book of machine language, if you learn quickly
You could also download Megamagazine (can't remember where and which issues) for a simple explanation of setting up Display Lists and adding colors and scrolling a player. I can find it out for you, just let me know. I think these ATR's are all around as they are free now I guess, ain't that so, Freddy Offenga (If you read this newsgroup anymore/at all) Take Atarian care and keep learning, it's a fun machine

What pure nonsense. Ever heard about Unix or other cross-platform OS'es
like, for example, CP/M ? Ever followed a course on structured programming ?

>

Not necisarely. There's no reason why transfer should be done byte-by-byte.
It should be quite easily to transfer a complete datapacket instead of just

one byte. Even cross-platform.

I don't see what graphics and sound have to do with a common interface
for networking. Or do you have your ethernet cable plugged into your
sound output ? I truly wonder if that's going to work...

516. Beginners questions about Atari 400

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-14 00:00:00 UTC
From: Scott McLauchlan <scott@isd.canberra.edu.au>
Message-ID: <34BC753B.C2EE7767@isd.canberra.edu.au>
Source record: 67063

Hello all!

I've just got my hands on an Atari 400, but it has no doco, so I need to ask a couple of stupid questions.

1) What sort of power supply do I need? The FAQ seems to suggest I need a 9V AC supply at about 1.7 Amps. Does the 400 *really* need that much juice, or will a 9V DC 1 Amp plug pack do the trick? Or have I misread the FAQ, and the 400 needs a different power supply?

2) Can the Atari 400 use "standard" Atari 2600 games cartridges?

3) Is there any way I can get my hands on a BASIC cartridge for the Atari 400? I can get access to an EPROM burner, so if the ROM image is available on the 'Net I can burn a ROM and put it in an old 2600 cartridge (assuming the pinouts are the same). Alternatively, is there anywhere I can buy a BASIC cartrige for the 400 (somewhere in Australia would be nice).

Thanks in advance!

Are you totally out of your mind? Do you really think he sold you the original box and manuals of the Magnetic Scrolls games but kept the original disks and sent you copies, hoping you wouldn't notice? Why on Earth would he do that?

The way I see it, he simply sold you the items he had, namely those two games, and he didn't care to check whether the disks should have proper labels or not. So maybe he was careless, but accusing him of piracy could (and should!) get you into serious legal trouble.

-- Dave

PS: Those Magnetic Scrolls games were not home-produced and should have properly labeled disks. On the other hand, I once bought a shrinkwrapped copy of Corruption which included the disks, the tape and the casino chip but no manuals at all. Instead, there was a photocopied piece of paper with "Loading instructions for the C-64" (in German!). Those things happen.

PPS: I bought the Delphine Collection (Cruise for a Corpse etc.) from Geoff Wallis. It was cheap, arrived here after a week and seemed to be complete. So I'm a happy customer of his :-)

Ok, I've compiled a preliminary list of what this new board would need.....

65816 14MHz
30-pin SIMM sockets
SIO port(s)
Expansion Bus(can you say "Reverse Engineer the 1090?
Good, I knew you could.")
80-Column Text
MMU (dual FREDDY perhaps?)
Hdd would be a nice bonus, but would probably be
better off being implemented on an add-in card.
Fit in an AT type PC case
Use a PC-type keyboard (or appropriately hacked ATR kb)
So what do yall think?
Just food for thought.

The PS is 9VAC 31VA (AC Watts) that translates to 3.4444 A. This is the
same PS used for most of the Atari peripherals (disk drives and such).
Whew... I guess they weren't very efficient, were they. The 800XL/130XE
PS is 5VDC @ 1.5A (7.5VA).

>
> 2) Can the Atari 400 use "standard" Atari 2600 games cartridges?

Simply put...NO. They are completely different animals. The 5200 is
much closer, but still not the same.

>

Atari BASIC carts are available from B&C Computervisions at
www.myatari.com. They also sell OSS BASIC XL and XE carts. I happen to
like these better (my opinion).

Dan,
Bob Puff of Computer Software Services (CSS) sells a kit to do this. I
think he also sells complete units. I don't have Bob address handy, byt
he's in Rochester, NY. His e-mail address is Bob Puff
<76702.1076@Compuserve.Com>. Whether he actually still uses it is beyond
me, but from what I can tell, it is still an active account.

I was talking about the route of ST, STm, STFM, MegaST, MSTe etc. which
were essentially the same machine with minal updates to either OS or
hardware beyond a few tweaks. The falcon is obviously a bigger jump but
realistically, with the ST coming out in 1985, the Falcon should have been
out by 88/89 to keep the momentum going. There *was* a machine intended to
be out then but when the designer (Shiraz??) left, no-one could pick up
the pieces to continue so they started afresh. Add in the huge amount of
management time spent sorting out the federated chain fiasco and you
essentially have the ST standing still from 1985 to 1992.

Hi Alain, if you want .ATR images, try the following addies:
http://www1.tu-chemnitz.de/~sgl/atari/demosind.htm
(demos here in MEGAIMAGES - you must have file menu.atr in 1st drive and
the megaimage (demos00x.atr) in 2nd drive.)
ftp://ftp.hackerz.com/megaimages with mirror at:
ftp://ftp.sodre.net/pub/users/cmwagner/atari8/mirrors/ftp.hackerz.com/megaimages/
there you'll find megs of games and the menu.atr file too...

ok, that should be all,
CU, PG

But Bry, I'm such a swell guy.

Don't worry, no more wars. Your points are well taken, I happen to
feel that Atari's graphics are superior to the C64's, but I feel
the C64 sound is better than Atari's, and so on and so on.

We all have our preferences, and by calling these two machines
brothers, I didn't mean identical twins, brothers can be
different as night & day - they just come from the same parents.

I wasn't saying they had the same hardware, but rather the same type
of design and spirit when compared to other machines.

Apples, TRS-80's, PETs, PCjr's & PC's all went "beep" while the 'brothers'
had advanced sound generation. I know that Atari's and the C64's video
were very different, but compared to other machines, they both had
advanced graphic capabilities. I thought this gave us some common
ground, but I guess 8-bit devotees are more zealous than ever.

> most of this thread has been emotional and not analytical in nature.

Well, it started-out as a plea for cooperation, but someone pulled
the wings of the dove of peace and things degenerated from there.
I apologized in another post, I love a good scrap, but there's
too many strong feelings out there to have this kind of fight in a
public forum.

Maybe the majority of us can never get along, guess I'm just an idealist.

No, I know that the US has the equivalent of the UK (and European) Data Protection Acts which make it a crimminal offence to store or transmit electronic data containing personal information without consent. Printing addresses in Usenet would fall under the scope of the Acts/Laws. In remember reading of a case of prosecution in the US for this very reason.

Curt,

Since you are using the 65816, the heart of a Nintendo Super NES, why
not figure out how to use the other chips (stereo & graphics) from the
Super NES too? Or get the Atari and the Super NES wired to a common bus
(the SNES expansion slot to the Atari SIO, for example), since as a
descendent of the 6502, the 65816 should allow the opcodes from the 6502?

```
-- Lurk off --
I'm back after a short (14 year) hiatus.
I've just found the ATARI800WIN emulator.
But I can't get it to write to ATR files. (no copy, no format, no write
dos, no nuthin')
I've tried it with several ATR's, Dos and Rom combos and even on
different PC's.
Seems to read ok, just no write.

I believe it would be better to go with a 72-pin SIMM slot, as unless you are going with 1meg SIMMs, 72-pin SIMMs offer more bytes for the buck. Also, 72-pin 16meg SIMMs are easy to find and relatively cheap, whereas a 16meg 30-pin SIMM is harder to find and more expensive, meaning allowing a full 16meg expansion economically with 30-pin SIMMs would really need to have 4 SIMM slots vs. a single one if a 72-pin SIMM socket was used. Less SIMM slots = lower cost due not only to fewer SIMM sockets, but also less PCB space required.

Another important feature, that CMD learned when doing the RAMcard for the SuperCPU 65816-based accelerator, is that using a 72-pin SIMM (which yes, can be accessed in 8-bit segments) allowed for interleaved memory access, since four 8-bit segments would always be present, regardless of the SIMM size fitted. When you are using a 14Mhz (or in their case, 20Mhz) 65816, even 60ns memory is too slow for true zero wait-state access.

As to the bus, I still vote for using something for which hardware already exists; either the proven 65xx compatible bus of the Apple II series, or PC ISA slots using either some type of bridge circuitry, or an x86 coprocessor handling the slots with dual-port RAM shared with the 65816 for control and communication.

The 1090 bus might be more in the "pure Atari" spirit, but you'll be kept waiting while someone decides there is enough demand to warrant the time and money it will take to design and build the cards. With an existing bus, someone needs only decide the demand is there to do the software, as the hardware already exists.

As to the case, going with an AT type case results in cheaper cases with a lot of choices, but the most of the ports would need to be mounted on panels that would take up the slots (although most have a couple of knockouts a couple of DB-9's [joysticks] and DB-25's can mount on), and some ports, such as the SIO, are too large to fit. For the SIO port, one would need to use a smaller connector (such as a PC joystick's full-size DB-15, or VGA's high-density DB-15), and have an external cable that converts it back to a standard SIO socket.

A more elegant solution would be to use an ATX case. These have a open panel area that provides for double-height connectors mounted to the motherboard, which would allow all the connectors, including the SIO, to be mounted directly to the back of the motherboard. True, these cases are typically slightly more expensive, and there are fewer designs to chose from, but I doubt it will remain that way. Try finding an non-ATX Pentium II motherboard, and you'll see what I mean.

As to the MMU, the standard scheme for addressing the first 128-256K should be fine, and then only needed for keeping compatibility for those few programs that require it. Since the primary use for extra RAM is as a RAMdisk, this could be better served by a RAMdisk routine that switches the 65816 from 6502 mode to native mode, grabs the data from anywhere in upper RAM, stuffs it into the lowest 64K where it is needed, and then switches back to 6502 mode.

I definitely agree on the ability to use a PC keyboard. This alone would be a big selling point. The ability to use the extra keys of a Win95 keyboard would also be a plus (although a Win95 keyboard should not be made a requirement).

I also agree with making at least standard 80-column text a standard feature, even if it was nothing more than monochrome (although 16-color CGA-type output could no doubt be done almost as cheaply). Hi-res and/or hi-color bitmapped graphics would be nice, but if they would add significantly to the cost of the board, should be kept as an option.

How about an FPGA?

Of course, even if it would work, I doubt it would be very easy to do
a reasonably accurate emulation without the ANTIC specs that Atari
lost with the VAX they sold.

It would likely be more effective to simply add a second video
processor, with its own memory, since new software would need to be
written in either case to address the new features.

Well, although strictly USB is a serial (actually a "bus", not just an interface), I believe that although he said "serial", he was strictly referring to RS-232.

Although card that use the 16C650 (good for 230.4Kbps) are available for the PC, I have yet to see one built-in on a motherboard. A large part of that likely has to do with PC motherboards not using actual discrete 16C550 UARTs (which are good for up to 115.2Kbps), but rather compatible UARTs that are part of a "do-it-all" I/O chip, that typically also handles parallel, game, floppy, and IDE. Until the makers of these I/O chips (Winbond, SMC, etc.) feel the pressure to upgrade the internals to 16C650 compatibility, they'll stick with the proven and profitable existing designs. With USB due to make a real world impact RSN, the push for faster onboard RS-232 will likely never come. (BTW, there is also a 16C750 chip, but I have yet to see a board in any computer peripherals catalog or ad that uses it...but then few people would probably have a need for its near 1 megabit per second [4x that of the 16C650, as I recall] top speed).

I tend to disagree here.
I think the XE's looked fine. No dark color anymore.
The keyboards are a lot better.
Anyway, that's how I feel about it.

I never doubted which computer to take.
My brother started out with an Atari 800, I owned a
S100 for more than a year already. At that time, the
Commo... Crommo... Commie... well that other machine
was not even on the market! The Atari was expensive though.
Appoximately $2,500 or so including disk drive and software.
Anyway, never regretted it a single minute.
We now own 40 Atari's or so (you need to have some backup's
you know...). I never understood the popularity of that other
machine... Why do one wants to own a Volkswagen Beetle, if one
could own a Ferrari?

Let's face it, Commo... well you know, s*cks.
So why are we reading those stupid commie messages in here.
I want to read about Atari, period.

Bo.

As someone who doesn't see why any part this thread is even in comp.sys.tandy
or why anyone there cares:

If you can site a specific case at the federal level for your above statement,
(eg, US Government vs somebody) do so. However, the fact that people in the
USA are able to sell millions of email addresses they obtained without the
prior permission of the owners of those email addresses (personal and business
addreses), and they are not being arrested indicates that there currently is
no such federal law.

In fact I had an FBI agent in the office yesterday, picking up evidence for a
grand jury on denial-of-service attacks, and when asked on this point he said
that selling the addresses reaped from news postings (as an example of the
taking of addresses without consent) was a grey-area and in his opinion he
probably could not create a solid case that a grand jury would idict someone
over.

I would be delighted to hear that there is a solid foundation for giving
these email-lists sellers a new job: making small rocks from big rocks.

The only thing I would like to add is that it contains 2 PC compatible 16550 UART RS232 ports and at least one bidirectional 25 pin PC standard parallel printer port (and maybe some printer drivers for more rescent printers). The hard drive interface (a requirement these days) should be either IDE, EIDE or SCSI. The IDE/EIDE would be a bit less expensive all around, but the SCSI is more adaptible and can support more devices at

one time.

Velcro,
There was one years ago (from or called) ABC compiler. It was strictly
for Atari BASIC. I never actually saw it, but knew of its existance.
That was around 1982/83. I have no clue if it still exists or (if it
does) if you can find a copy.

548. 850 Cable and Tackball Games

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-15 00:00:00 UTC
From: Stephen Knox <gooch@erols.comX>
Message-ID: <34BDFF8C.B588F8ED@erols.comX>
Source record: 67003

2 totally unrelated questions:

1. What cable do I need to buy from B&C to hook my standard parallel printer to my 850? the 850 side seems to have a strange connector on it.

2. What games support trackball mode besides Missile Command for the Atari8's(or even the 5200 conversions done)?

There were many BASIC compilers made for Ataris. Many went beyond standard
Atari BASIC in what they offered, and all produced fast-running programs.
ABC BASIC was mentioned by Robert Smith Ely. I owned one produced by Advan
Language Systems for a while, but did little with it.

Of course, there's always compiled TurboBasic.

There are guys who will never buy a PC or Mac. Call them cheap, or frugal, or scared, or whatever, but they are suddenly aware that an Internet exists and they want to be able to access it with the computers they now own.

I must confess that I use my PC for Internet access, but a good part of what I get with my PC goes toward supporting the 8-bit community and helping the guys in my user group.

Just take the Pool Disk, which you and Ernest put together so well, as an example. At the time that my group bought it, I was appointed its custodian because at the time I was the only one with a PC that had a CD-ROM drive and an SIO2PC. Two years later, the other guys are happy that I keep putting programs from it into our newsletter. But even though some of them now own new PCs, NOBODY has asked me how to get an SIO2PC cable or to borrow the Pool Disk. They're happily dependent on me for Pool Disk access, just as they're dependent on me for Internet access.

All of this will change in the spring, when our public library system is due to offer free internet access to patrons. I can't see these guys going out and buying PCs. I can see them wanting to use their Ataris for accessing this ng and for e-mail.

And then there's the Web. Why should they be left out of that?

No, the people who want to write Internet software, up to and including Web browsers for the Atari 8-bits or for any 6502 machines won't get rich off the guys I described above. But why deny them the challenge of writing such software even if the market is small?

So, we've identified two groups of admitted hobbyists who can at least try to satisfy each other's needs.

552. Commie with HD and real dos

Can you imagin a Commie with a 1.2gig HD and a dos that can access it?
I know you cant... or even better, With a Multi-plexer and 8 nodes?

At one time I was planning to run Star NET on a Commie setup, at that point I looked into there Hard drives system and almost died. I belive it was called the 'CHEFF' or Magic "Cheff" it came with 10 meg HD and software for 96 - 180k partitions. And to really top the cake, the designers of this thing slow the HD speed down to that of the 1541.

Sure I was a Commie user, it had lots of great games. Almost as but NOT as good as the new stuff we got from Poland the last few years. Oh we had ARC but not real ARC, LZH but NOT real LZH hmmm...

Atari was the way to go for real power in the 8bit world, and about SID music yeah it was good, But no way as good as the 8bit Atari with CMC or MPT software.

It's funny: in Centipede there is a switch-key for trackball (ctrl-t).
It seems not to work correctly, but It does something !?
I haven't tried MC yet, but I don't think that both trackball's I own are
defect ...

I remember considering buying one of those when they came out (and for quite some time afterward). I changed my mind when I actually SAW one, though, because (unless I drastically misunderstood what I was seeing) it turned out to be a THREE-inch, _not_ three-and-a-half-inch, drive. I suppose you could easily get disks for it at the time it was made, but I foresaw that it would soon be IMPOSSIBLE, as indeed it now seems to be.

I'll be interested to see whether anyone else recalls the Amdek drive the same way I do...

Now, can you REALLY read the address? Not Harry's address, but Geoff's? I can barely make out most of it....but there is a lot of missing information.

I doubt the intent was to post his address, and anyway, I think fussing over posting someones address is just that, fussing. I can always look up anyones address if I really want to.

It's funny how more people jumped on Harry inadvertently posting Geoffs stupid address than Geoff actually ripping Harry off....amazing how people can focus on such absurdities and avoid the REAL issue at hand.

Greetings! It is pre-Spring cleaning time, and I am offering this
entire bundle of hardware, software, and books/magazines for sale.

Hardware:

Atari 800 Computer
Atari 850 Interface
Rana Systems 1000 Disk Drive
Joystick
Power Supplies (6)
Connecting Cables (2)
Serial-to-Parallel Cable

Software:

AtariWriter Cartridges (2, with manuals)
Atari Basic Cartridge

Books:

Poole, Your Atari Computer
Moore, Lower, & Albrecht, Atari Sound and Graphics
Bell, The VisiCalc Book
Albrecht, Finkel, & Brown, Atari Basic
Poole, Borchers, & Cook Some Common Basic Programs
Haskell, Atari Basic
A.N.A.L.O.G. Computing, The ANALOG Compendium (1983)

Magazines:

ANALOG, #12 (July-August, 1983) through #55 (June 1987),
missing numbers 48 and 50;
Atari Connection, Summer 1983 through Summer 1984;
ST Log, #11 (February 1987) and #12 (March 1987);
Atari Explorer, February 1985

Everything is in working order and in very good condition. The entire
bundle is currently being offered via the eBay on-line auction service,
and can be found at the following address:

http://komodo.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=4370773

>
> Are you totally out of your mind? Do you really think he sold you
> the original box and manuals of the Magnetic Scrolls games but kept
> the original disks and sent you copies, hoping you wouldn't notice?
> Why on Earth would he do that?

Why would the seller believe unlabeled disks were original disks, and not
mention them to the buyer?

> The way I see it, he simply sold you the items he had, namely those
> two games, and he didn't care to check whether the disks should
> have proper labels or not. So maybe he was careless,

You've got to be kidding.... Proper labels? How about NO labels?
Careless, how about negligent?

> but accusing
> him of piracy could (and should!) get you into serious legal
> trouble.

You're kidding, right? Do you really believe what you typed? He can't
get into any legal trouble by stating the truth. The seller sold him
disks with no labels, it is common sense to assume they may be illegal
copies.

As I see it, it is common sense to assume UNLABELED disks are copied
disks. This is NOT a careless mistake. If you ask an 8 year old, he can
tell the difference between a copied disk and an original.... If the
disks are unlabeled, it was the sellers responsibility to state that to
the buyer. Given this, the seller misrepresented the product, and should
refund the money IN FULL to the buyer...including shipping. If the
seller intentionally misrepresented the items, then this is called FRAUD.
Again, this falls back to common sense, and ANYONE, well, except may be
you, knows that an unlabeled disk IS MOST LIKELY A COPY, and this
information should have been conveyed to the buyer.

After the buyer received the disks the seller admitted, the disks were
unlabeled. Now, whether the seller did the copying or not, is yet,
another story.

It's really unbelievable that anyone would actually believe the seller
could sue the buyer for the buyer stating UNDISPUTED facts.

565. Commie with HD and real dos

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-15 00:00:00 UTC
From: guy1015@aol.com
Message-ID: <19980115120600.HAA00738@ladder02.news.aol.com>
Source record: 67020

Can you imagin a Commie with a 1.2gig HD and a dos that can access it?
I know you cant... or even better, With a Multi-plexer and 8 nodes?

At one time I was planning to run Star NET on a Commie setup, at that point I looked into there Hard drives system and almost died. I belive it was called the 'CHEFF' or Magic "Cheff" it came with 10 meg HD and software for 96 - 180k partitions. And to really top the cake, the designers of this thing slow the HD speed down to that of the 1541.

Sure I was a Commie user, it had lots of great games. Almost as but NOT as good as the new stuff we got from Poland the last few years. Oh we had ARC but not real ARC, LZH but NOT real LZH hmmm...

Atari was the way to go for real power in the 8bit world, and about SID music yeah it was good, But no way as good as the 8bit Atari with CMC or MPT software.

Sorry, Curt, but you are missing a big point here. At that time Atari did not have the Sega lawsuit money yet. Sales of ST based machines were WAY down. They needed a new product fast. Of course, now it's easy to say that they should have waited another six months. Yes they should have. But at the given time, they didn't have much choice. Look at the financial reports. The company was bleeding. Yes, I know the Jaguar did not turn things around. But the urge to do something was there.

One mistake I grant you, they should have put much more effort into software development for the machine early on. I think development time for 3rd generation systems was underestimated. People should have been aware that these are not your typical write it in six months side scroller games.

Apple, Atari, Commodore and others - they all missed the market change to open systems. Companies forming alliances to set standards. The old guys were used to do everything themselves, from computers to software to printers, disk drives and monitors. Look at Apple, they did do a much better marketing job than Atari and Commodore. They did have slots since the Mac II. They did address the business world. Still, they are going down. Because they thought of being something special. Without realising they were just at the right place at the right time. And you won't keep that privilege forever. Only the paranoid survive.

Yes, at last! The other good news is that I've just managed to
buy an Atari 800XL + tape drive, 2 joysticks and 40 games for ï¿½20.
My old disk drive is dead tho' so my next quest is to find one...

[interesting quote encountered]

Jt> Ok, let me explain again, computers don't have races, ok?
Jt> Repeat after me, computers are machines, computers are machines...

[snip to end of long message]

Hmmm, that's probably the main difference between "that other computer"
owners and real Atari owners. I don't think of my Atari as a computer,
sorry. I think each 8 bit I have has a soul. So call me stupid,
I don't care. When I attend a computer fair (very often), and see
an Atari being sold, I think "It looks like that one needs a home",
and buy it on the spot. I do not have that feeling when I see
"that other computer".
If I see 2 cars, both having an engine (of type 6502), I can feel
more affection for one car than the other one, that's called human.

Computers are machines? Hmmm, would you call Mr. Data a machine???
Ask kids if their Tamagotchi is a computer or toy.
Atari is not a computer, it's way of living, making a statement...
Maybe it's my Tamagotchi...

Bo.

Which I wouldn't mind though.

[snip more interesting stuff]

Br> Hopefully I won't end up on anyone's (esp Noah's) attack list, but
Br> most of this thread has been emotional and not analytical in nature.

For me it IS emotional, sorry.
I don't care that much about differences between the 2. Their both computers, and tasks can be done on them in much the same matter (remember the games with on one side the Atari version, and on the other side the "other" one's version?).
So, basically one would choose a computer based on personal feelings (like one chooses a car I guess).
In my case it was Atari. You're not buying a computer, but a lifestyle (like when one buys a Harley Davidson).
Maybe a firewall will do?

Bo.

I used to have Turbo Basic. That gave lots of new commands to Atari Basic
(and fully backward compatible), was quicker when interpreted *and* could
compile to c-code (needed a runtime library, ala v-basic)

> When I was a kid I wrote some strange things for Atari 8, but the

This message thread is Machine VS Machine ... Read header.

If there was a REAL SLIP browser for the commie it would also be a kludge and buggy. Atari 8bit is the BEST 6502 machine made - bar none - While this message is not to make you laugh, look for some real strong software already programed:

Iceterm
Apacview
Term80

Contack the authors for (code) Help, and you could make a GREAT SLIP for the 8bit Atari. I would like to use one.

8bit for ever (Atari)

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Thursday, January 29, 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges/manuals/magazines; $6.95 if package includes systems, modules, hardware, or more than 2 books. I'll pay any difference. Some items require actual shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClassicAuc@aol.com.

Nintendo 64 - Complete in Boxes
N1. Mario Kart 64 (complete with box/instructions, excellent condition) -$24.95 min

Atari 5200 Cartridges - New in Boxes
1. Keystone Kapers. New in box (unsealed) -$9.95 min

2. Zone Ranger. New in box (unsealed) -$9.95 min

Atari 5200 Single Cartridges
3. Astrochase (very good label) -$3.95 min
4. Ballblazer (excellent label) -$1.95 min
5. Berzerk (very good label) -$1.95 min
6. Blue Print (very good label) -$2.50 min
7. Centipede (excellent label) -$1 min
8. Countermeasure (excellent label) -$1 min
9. Defender (excellent label) -$1.95 min
10. Dig Dug (excellent label) -$1.50 min
11. Dreadnaught Factor (light label wear along edge) --$3.95 min
12. Frogger (very good label) -$1 min
13. Frogger II ThreeeDeep! (excellent label) -$9.95 min

87. Super Cobra -$1.95 min

Atari 7800 Cartridges New in Boxes
88. Donkey Kong Jr. (without shrinkwrap) -$1.50 min

Atari 8-Bit Computer Accessories
A1. AtariWriter Cartridge with complete set of manuals: 50 page spiral bound manual, Quick Reference Card, and Helpful Hints fold-out card. -$6.95 min
A2. Atari Assembler Editor Cartridge CXL4003. With 79 page User's Manual and Programmer's Reference Card. -$6.95 min

A3. Koala Pad: includes Koala Pad touch tablet, original stylus, Micro Illustrator Owners Manual and Touch Tablet Owners Manual. Very Rare. No disks. -$6.95 min

Atari 8-Bit Computer/XE Game System Cartridges
A4. Kindercomp cartridge. -$1 min
A5. Centipede cartridge -$1 min
A6. River Raid cartridge -$2.50 min

Atari 8-Bit Computer/XE Game System Cartridges
(New in boxes with instructions - not sealed)
A7. Ballblazer -$5.95 min

Atari 8-Bit Computer - Disks
A8. HomePak (flip side for C64) , Batteries Included disk -$1 min
A9. Ken Uston's Professional Blackjack (flip side for C-64) with Operating Instructions manual. -$1.25 min
A10. Party Quiz Game Question Disk (General Edition 1) , Suncom. Flip side for C-64. -$1 min
A11. F-15 Strike Eagle, Micropose disk -$1 min
A12. Print Shop Graphics Library 3 with Reference Card. -$1.25 min
A13. Atari Word Processor Program Master Diskette (CX8119) -$1.95 min
A14. APX Insomnia Sound Editor with instructions. Lets you create 4-voice sound or simple sounds lasting up to 4 seconds. Then, you can install the sounds in your BASIC programs with an included machine language subroutine. -$1.95 min
A15. S.A.M. Software Automatic Mouth speech program disk, Don't Ask Computer Software -$1 min
A16. Track Attack game disk, Broderbund -$1 min
A17. Hacker game disk, Activision -$1 min
A18. Drol game disk, Broderbund -$1 min
A19. Master of the Lamps game disk, Activision -$1 min
A20. The Great American Cross Country Road Race game disk, Activision -$1 min
A21. Maxi Golf game, Activision 2 disk set -$1 min

Atari Controllers
A22. Standard Atari Paddle Controllers (pair) -$1.95 min
A23. Atari Standard Joystick (single) -$1.95 min
A24. Atari Standard Joystick (single) -$1.95 min

Miscellaneous
A25. Flip and File - Clear smoke colored plastic. Holds over 40 5 1/4 floppy disks (elephant disk sticker on front). -$1.95 min
A26. Flip and File - Same as above. -$1.95 min
A27. Super Nintendo Mortal Kombat II Instructions -$.25 min
A28. Mouse House. Cover for standard computer mouse. Looks like a mouse. -$1 min
A29. RF cable (fits Atari 7800/Colecovision) - approx. 12 feet long -$.50 min

Books/Instructions
A30. Energy Czar Computer Program Instructions (20 pages) -$.25 min
A31. APX Ultimate Renumber Utility Instructions -$.25 min
A32. APX (Atari Program Exchange) Keyboard Organ Instructions -$.25 min

A33. APX (Atari Program Exchange) Sketchpad Instructions -$.25 min
A34. APX (Atari Program Exchange) Video Math Flashcards Instructions -$.25 min
A35. APX (Atari Program Exchange) Presidents of the United States Instructions -$.25 min
A36. Master Memory Map by Santa Cruz Software. 100s Important Memory Locations. Hints on Their Use. 14 pages of reference material. -$2.95 min
A37. Master Memory Map by Educational Software by Educational Software. 30 pages. How to PEEK and POKE., IOCBs, System Timers, Color Locations, Player Missile Graphics Registers, Bugs in Atari BASIC, Bugs in the O.S. Much more! -$2.95 min
A38. ANALOG Computing Pocket Reference Card. BASIC Instructions, XIO Command Codes, Sound Command Pitch Values, Player/Missile Area Layout. 6502 Assembler Mnemonics, Error Messages, Code Translation Table, More. -$2.95 min
A39. Atari BASIC Reference Manual in excellent condition. 100 pages, 3-hole punched. Originally shipped with Atari BASIC cartridge. -$4.95 min
A40. Atari 810 Disk Drive Owner's Guide. CO60056. Rev. 1 (full color) . -$1 min

It was evidence that the seller, who stated he didn't know the buyers name, lied. It did add something.

> You don't go
> around hurting others just because you got hurt.

Really? You really believe posting someones partially readable address hurts them? That is just plain silly.

> Stop, think, then don't post binary in a non-binary group.

It was was a very small binary. I believe it was appropriate. Stop, think, your self. There is more flack about this silly address thing (which is NOT readable) by the group whiners than could ever have been taken up by the appropriately posted picture, also, the original issue, the seller misrepresented the goods has been lost due to a bunch of whiney fussers who, for some nonsensical reason, whom have jumped on the 'evil partially unreadable address poster (Harry)'.

It's funny how some people just ignore the matter at hand, pay no attention to the facts, yet pursue some random tangent that they feel is sooooo important, when it is completely nonsensical and irrelevant. Go figure.

Nobody help him. Visit his webpage. He is a lover of the c128. Didn't he see
the Atari vs. CBM thread?

Here is some stuff from his page:

"I'm interested in good old 8-bit Commodore computers (especially the Commodore
128). These computers are probably the
best programmed computers in the world. Commodore programmers have made (and are
making) these humble machines do
things the Commodore designers never even dreamed of."

!!IM JUST
KIDDING!!!

Welcome to the wonderful world of Atari David!

I seem to remember WAY back somebody was talking about a project very similar to this one. I think it went under the thread "Atari with detachable keyboard" er something like that.

Anyway, there was lots of talk about how many orders would be needed to justify it, blah blah blah, it never got done blah blah blah

I really like my stock 800xl. I like the keyboard. I like the case. I like the sounds it makes. I like all of the cables everywhere. I even like my 40 (or 38?) columns.

Is somebody suggesting we turn these wonderful little computer into a Super NES? ARGHH!!!!!

What is this Atari800Win emulator I keep hearing about? Is it a Win95 incarnation of the DOS Atari800 emulator? Is it freeware, shareware, commercial or what? Is it any good? I have Xl-It and Xformer 3.6 for DOS and the limited demo of Rainbow for 95. They seem good or ok. Wondering what all the excitement with this one is.

Might be the power supply too. The "brick" type would fade till the
system
was starved and the result was usually a locked system with a solid
color
screen. If he was getting occasional crashes he could try moving the
supply
to a know working system and see if it works...

>
>*** Please make sure responses are also sent via email.

I personally found the xl-it to be the better of the two - if you don't
have a win95 joystick you won't be able to play any games, and sound
support is a little sketchy.

Anyway point your browser at http://www.cris.com/~Twist/atari800win/
for more info.

Luddite that I am, I prefer the DOS version, xl-it (even though I've got
to set the pal refersh rate or everything wizzes past at a hell of a
rate).

I get to pick up my 800xl, tape drive, two joysticks and 40 games for 20
UKP on Sunday (grinning like a happy child...)

Engineers as a group move at the end of projects to follow their own
ideals.Usually all companies need time to recoup their development costs
by
building and selling PRODUCTS. their primary motivation

> The Amiga would have been designed in house by Atari and
> released earlier if their attitude had been different - possibly
> giving it a jump on the Macintosh.

Amiga development was running way over cost during its developmentIf
Atari had gotten involved the way your suggesting Atari would have
been bankrupt. Amiga development stopped because of the lack of
necessary
funding.

> So many companies could have had a huge impact on the market if they'd
>
> just kept up. No matter what you think of the various computer
> companies of the 80's, they all gave the market away

No one really had an understanding of the "market".. Each was tryingin
its own way to be successful

> . The PC only won
> because IBM built such a simple machince and it got cloned.

IBM didn't want the PC cloned. They used off the shelf components,but
kept the information about its operating system (BIOS) a secret.
It took the first company over 1 million dollars just to legally reverse

engineer the bios.

The real reason that the PC was successful was due to a pre-existing
IBM strengths. IBM was willing and able to SERVICE the PC anywhere.
Business then chose the IBM because back then IBM had the reputation
of understanding computers due to their successful mainframe business
IBM was simply the biggest and they were the only company ready to
and able to send an engineer to your location of business to fix it.
(They already had a service staff for their mainframe, typewriter and
dictation equipment business) ,That reduced down time,and down
time meant lost revenue.(Apple was close with authorized service
centers)
As the IBM systems became successful within business, people who
wanted to be able to take work home (to get a jump on their co-workers)
purchased a IBM system or later a IBM clone for themselves.

> IBM has
> spent the time since trying (unsuccessfully) to regain control in the
> PC market.
>
> -Bry

IBM starting losing control after the BIOS was cloned. Microchannel
was their only real attempt to regain control of the market.

Just to set the record straight....

Personally I felt the Atari design elegant, advanced. Warner simply
didn't
understand how to advance Nolan Busnell ideas.

Actually,

The New Atari 8-bit with detachable keyboard project was started by myself and a friend in Utah, we had started but costs got to be way too high and both of us ran out of spare time to continue it so its shelved for right now, but not forgotten, believe me when I say 'we've already looked at everything thats been mentioned so far and most is possible, but at a cost which few individuals can afford, unless you know any avid Atari enthusiasts with $50k-$100 for design and small run production costs?

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the
Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL,
800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend,
several people volunteer their time and energies by maintaining Periodic
Informational Postings for this newsgroup. Please take a moment to refer to
these documents before posting to comp.sys.atari.8bit. The answer to your
question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic
Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current

>information.

Am I missing something here - or rather seeing something that no one else sees?! His address was *printed* (typed) by zzyzx in a message dated 11/1/98 (it's still available on my server.) I've asked, just out of curiosity, a friend of mine who's a lawyer and I've been told that this is without doubt illegal should George Wallis wish to make a formal complaint. ISP's in the UK and US have procedures for dealing with such complaints which are then passed on to the relevant authorities.

The lesson is simple: be careful.

599. Best atari emulator??

I've seen a few different sites, and was wondering what's the best emulator for my old ataris?? I've got three of them, and a ton of software, and grabbed lots of the executables a while back, but had quite a bit of probelms getting alot of them to run.. rescue at fractalus was VERY fast, but the keyboard commands didn't work (and no one has ever given me a reply at to whether they've gotten it to run correctly, and on what emu..

I also never got bounty bob strikes back to work either...

Oh and does anyone have any of the old synapse software boxes they would part with?/ I'm trying to preserve the box art from them, and have some of the posters they put out to the stores, but alot of them are missing....

any help (hell, ALL help) will of course be appreciated!!

(Oh! and if you owned an atari around Cleveland back when they were out, ya probably knew me from the biggest store that sold them there, and the atari users group....)

I think you misunderstand what I'm saying so I'll spell it out. You feel ripped off by Geoff Wallis. Understandable (although why he'ld rip you off in the way you describe doesn't really make sense - could there be a logical explanation?) Does that give you the right to print his postal address? Would just his name have sufficed? If anyone printed my postal address in usenet without my permission I would make sure that legal action was taken through established crimminal law procedure - firstly it's a real breach of privacy and secondly there are just too many bloody wierdos out there in net land. (I'ld also not trade with anyone who printed an address - misunderstandings and problems do happen and I wouldn't like to be on the receiving end of this type of behaviour.)

This doesn't deny the fact that you feel ripped off or that you may have been ripped off. The problem is that Geoff Wallis hasn't posted a response here himself - hasn't defended himself.

Gareth Davies.

I agree that when someone posts a residential address saying "this guy ripped me off" it's sort of an invasive situation for the person who has his address posted. And there are two sides to every story.

I started using a pseudonym/nick after repeated reading crazed weirdos who liked to post addresses, make harassing and threatening phonecalls, and spend hours doing dejanews author searches.

Still, I understand the anger when you think you've been ripped off. A long timer on this group (who has posted recently) agreed to transfer my Atari8 diskettes to ATR's, in exchange for some small amount of money and most of the diskettes. I sent them off and waited 3 weeks, asked him about them, waited 5 weeks, asked him again. The third time (7 weeks) I said "hey what's the holdup" he said I was the rudest most obnoxious person he had ever dealt with. He sent back my diskettes but I believe he kept AR City's Disk A, as well as Apshai Trilogy diskette, and probably a couple more.

So I understand.

> (although why he'ld rip you off
> in the way you describe doesn't really make sense - could there be a logical
> explanation?)

Yes, someone else has the original disks....Now is that such a far
stretch?

> Does that give you the right to print his postal address?
> Would just his name have sufficed? If anyone printed my postal address in
> usenet without my permission I would make sure that legal action was taken
> through established crimminal law procedure

And you'd waste a lot of your own time and money, and be laughed out of
court. People who behave like this are called 'litigious', and generally
not taken seriously.

> - firstly it's a real breach of
> privacy

Oh, please. Addresses are public information. If he wrote it on a
package....did he hide it when he took it to the post office so no one
else would see it?

> and secondly there are just too many bloody wierdos out there in net
> land.

And I believe we've found one...cruising the Atari8 news group....anyone
who would sue someone for posting their address is weird. Again, anyone
wanting an address can get it from MANY publicly available sources.

> (I'ld also not trade with anyone who printed an address -
> misunderstandings and problems do happen and I wouldn't like to be on the
> receiving end of this type of behaviour.)

Your prerogative....and your business.

> This doesn't deny the fact that you feel ripped off or that you may have
> been ripped off. The problem is that Geoff Wallis hasn't posted a response
> here himself - hasn't defended himself.

His response was posted by Harry in his first post.... I don't believe
he has ANY defense....he probably believes what he said in the his
recount in the first post....which would lead me to believe he is either
unreasonable, or just plain naive.

Austin

It is the fallback position after: no cart, no cassette, no disk,
so there's no code to run. Bank switching ROM wasn't really
thought of in the 8-bits in 1979, so without any of the above
there is nothing else for the computer to do.

Wasn't that memo pad? Not that it makes any difference...

I guess they wanted to give it *some* name, and memo pad was the closest
thing you could call a blank typing screen.

Fernando

Scott McLauchlan (scott at isd dot canberra dot edu dot au) wrote:
->> What sort of power supply do I need? The FAQ seems to suggest
->> I need a 9V AC supply at about 1.7 Amps.

To which, On Wed, 14 Jan 1998, Robert S Ely (rsely at dhs dot state dot nj dot us) replied:
-> The PS is 9VAC 31VA (AC Watts) that translates to 3.4444 A.
-> This is the same PS used for most of the Atari peripherals (disk
-> drives and such).

The power supply that came with my 400 in 1982 is 9V AC, 15.3 VA (18.5W). 9 times 1.7 = 15.3, so the FAQ is correct.

Whether the 9VAC-31VA power supply works on a 400 is another matter, but it's much too broad a claim to say that it's used for "most" Atari 8-bit peripherals. It's okay for the 800 computer and the 810 and 1050 disk drives, but I wouldn't try it on any other peripheral unless the FAQ file says so. (I saw a vendor at a show some years ago stubbornly insist that the 9VAC-31VA PS worked on everything, including non-Atari Company products like the Indus. He would plug in the 9VAC-31VA PS, try to turn on the item, get no response, and then say, "Guess this drive's dead. ... Well, that one's dead too. ... Hmmm, this one's also dead." Some people don't believe in reading the instructions!)

January Auction - Update 1

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Thursday, January 29, 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges/manuals/magazines; $6.95 if package includes systems, modules, hardware, or more than 2 books. I'll pay any difference. Some items require actual shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClassicAuc@aol.com.

Nintendo 64 - Complete in Boxes
N1. Mario Kart 64 (complete with box/instructions, excellent condition) -$24.95 min

Atari 5200 Cartridges - New in Boxes
1. Keystone Kapers. New in box (unsealed) -$9.95 min

2. Zone Ranger. New in box (unsealed) -$9.95 min

Atari 5200 Single Cartridges
3. Astrochase (very good label) -$3.95 awwatkin
4. Ballblazer (excellent label) -$1.95 min
5. Berzerk (very good label) -$1.95 min
6. Blue Print (very good label) -$2.50 min
7. Centipede (excellent label) -$1 min
8. Countermeasure (excellent label) -$1 min
9. Defender (excellent label) -$1.95 min
10. Dig Dug (excellent label) -$1.50 min
11. Dreadnaught Factor (light label wear along edge) -$3.95 min
12. Frogger (very good label) -$1 min
13. Frogger II ThreeeDeep! (excellent label) -$9.95 awwatkin
14. Galaxian (excellent label) -$1 min
15. H.E.R.O. (excellent label) -$3.95 min
16. Jungle Hunt (very good label) -$1 min
17. Kangaroo (excellent label) -$1 min
18. Mario Brothers (excellent label) -$1.95 min

20. Missile Command (excellent label) -$1 min
21. Montezumas Revenge (excellent label) -$9.95 awwatkin
22. Moon Patrol (excellent label) -$1.95 min
23. Mr Do's Castle (excellent label) -$4.95 tempest
24. Ms. Pac-man (very good label) -$1 min
25. Pac-man (excellent label) -$1 min
26. Pengo (excellent label) -$1.95 min
27. Pitfall II excellent label) -$2.95 min
28. Pole Position (excellent label) -$1 min
29. Popeye (excellent label) -$1.95 min
30. Q*Bert (very good label) -$1 min
31. Qix (excellent label) -$1 min
32. Realsports Football (very good label) -$1 min
33. Realsports Soccer (very good label) -$1 min
34. River Raid (very good label) -$1.50 min
35. Robotron: 2084 (excellent label) -$1.95 min
36. Space Dungeon (excellent label) -$1.95 min
37. Space Invaders (excellent label) -$1 min
38. Star Raiders (very good label) -$1 min
39. Star Wars Arcade (excellent label) -$4.95 tempest
40. Super Breakout (very good label) -$1 min
41. Vanguard (very good label) -$1.50 min

Atari 5200 Overlays
(All in excellent condition.)
42. Super Breakout pair -$2 min
43. Star Raiders single -$2 min
44. Centipede pair -$2 min
45. Space Invaders pair -$2 saxymanny
46. Missile Command pair -$2 min
47. Defender pair -$2 saxymanny

48. Galaxian pair -$2 min
49. Qix pair -$2 min
50. Frogger pair (excellent condition) -$4 min

Atari 5200 Manuals
51. Atari 5200 Owners Manual (full color) -$1.95 min
52. Ballblazer -$1.95 min
53. Buck Rogers -$1.95 min
54. Centipede -$1.95 min
55. Congo Bongo -$1.95 min
56. Countermeasure -$1.95 min
57. Defender -$1.95 min
58. Dig Dug -$1.95 min
59. Dreadnaught Factor -$2.95 min
60. Frogger -$1.95 min
61. Frogger II Threeedeep! -$3.95 min
62. Galaxian -$1.95 min
63. James Bond 007 -$3.95 min
64. Joust -$1.95 min
65. Jungle Hunt -$1.95 min
66. Mario Bros. -$1.95 min
67. Megamania -$1.95 min
68. Missile Command -$1.95 min
69. Montezuma's Revenge -$3.95 min
70. Moon Patrol -$1.95 min
71. Mr Do's Castle -$1.95 min
72. Ms. Pac-Man -$1.95 min
73. Pac-man -$1.95 min
74. Pengo -$1.95 min
75. Pitfall II Lost Caverns -$1.95 min
76. Pole Position -$1.95 min
77. Popeye -$1.95 min
78. Q*Bert -$1.95 min
79. Qix -$1.95 min
80. Realsports Football/Home Football Playbook -$1.95 min
81. Realsports Soccer -$1.95 min
82. Realsports Tennis -$1.95 min
83. Space Invaders -$1.95 min
84. Space Shuttle -$1.95 min
85. Star Wars Arcade -$3.95 min
86. Super Breakout -$1.95 min
87. Super Cobra -$1.95 min

Atari 7800 Cartridges New in Boxes
88. Donkey Kong Jr. (without shrinkwrap) -$1.50 min

Atari 8-Bit Computer Accessories
A1. AtariWriter Cartridge with complete set of manuals: 50 page spiral bound manual, Quick Reference Card, and Helpful Hints fold-out card. -$6.95 min
A2. Atari Assembler Editor Cartridge CXL4003. With 79 page User's Manual and Programmer's Reference Card. -$6.95 bgomes

A3. Koala Pad: includes Koala Pad touch tablet, original stylus, Micro Illustrator Owners Manual and Touch Tablet Owners Manual. Very Rare. No disks. -$6.95 min

Atari 8-Bit Computer/XE Game System Cartridges
A4. Kindercomp cartridge. -$1 min
A5. Centipede cartridge -$1 min
A6. River Raid cartridge -$2.50 min
A6a. Robotron: 2084 (computer style) cartridge -$3 min

Atari 8-Bit Computer/XE Game System Cartridges
(New in boxes with instructions - not sealed)
A7. Ballblazer -$5.95 min
A7a Rescue on Fractalus! -$5.95 min

Atari 8-Bit Computer - Disks
A8. HomePak (flip side for C64), Batteries Included disk -$1 min
A9. Ken Uston's Professional Blackjack (flip side for C-64) with Operating Instructions manual. -$1.25 min
A10. Party Quiz Game Question Disk (General Edition 1), Suncom. Flip side for C-64. -$1 min
A11. F-15 Strike Eagle, Micropose disk -$1 min
A12. Print Shop Graphics Library 3 with Reference Card. -$1.25 min
A13. Atari Word Processor Program Master Diskette (CX8119) -$1.95 min
A14. APX Insomnia Sound Editor with instructions. Lets you create 4-voice sound or simple sounds lasting up to 4 seconds. Then, you can install the sounds in your BASIC programs with an included machine language subroutine. -$1.95 min
A15. S.A.M. Software Automatic Mouth speech program disk, Don't Ask Computer Software -$1 min
A16. Track Attack game disk, Broderbund -$1 min
A17. Hacker game disk, Activision -$1 min
A18. Drol game disk, Broderbund -$1 min
A19. Master of the Lamps game disk, Activision -$1 min
A20. The Great American Cross Country Road Race game disk, Activision -$1 min
A21. Maxi Golf game, Activision 2 disk set -$1 min

Atari Controllers
A22. Standard Atari Paddle Controllers (pair) -$1.95 min
A23. Atari Standard Joystick (single) -$1.95 joseph red
A24. Atari Standard Joystick (single) -$1.95 min

Miscellaneous
A25. Flip and File - Clear smoke colored plastic. Holds over 40 5 1/4 floppy disks (elephant disk sticker on front). -$1.95 min
A26. Flip and File - Same as above. -$1.95 min
A27. Super Nintendo Mortal Kombat II Instructions -$.25 min
A28. Mouse House. Cover for standard computer mouse. Looks like a mouse. -$1 min
A29. RF cable (fits Atari 7800/Colecovision) - approx. 12 feet long -$.50 min

Books/Instructions
A30. Energy Czar Computer Program Instructions (20 pages) -$.25 min

A31. APX Ultimate Renumber Utility Instructions -$.25 min
A32. APX (Atari Program Exchange) Keyboard Organ Instructions -$.25 min
A33. APX (Atari Program Exchange) Sketchpad Instructions -$.25 min
A34. APX (Atari Program Exchange) Video Math Flashcards Instructions -$.25 min
A35. APX (Atari Program Exchange) Presidents of the United States Instructions -$.25 min
A36. Master Memory Map by Santa Cruz Software. 100s Important Memory Locations. Hints on Their Use. 14 pages of reference material. -$2.95 min
A37. Master Memory Map by Educational Software by Educational Software. 30 pages. How to PEEK and POKE., IOCBs, System Timers, Color Locations, Player Missile Graphics Registers, Bugs in Atari BASIC, Bugs in the O.S. Much more! -$2.95 min
A38. ANALOG Computing Pocket Reference Card. BASIC Instructions, XIO Command Codes, Sound Command Pitch Values, Player/Missile Area Layout. 6502 Assembler Mnemonics, Error Messages, Code Translation Table, More. -$2.95 min
A39. Atari BASIC Reference Manual in excellent condition. 100 pages, 3-hole punched. Originally shipped with Atari BASIC cartridge. -$4.95 bgomes
A40. Atari 810 Disk Drive Owner's Guide. CO60056. Rev. 1 (full color). -$1 bgomes

>court. People who behave like this are called 'litigious', and generally
>not taken seriously.

I'm trying my best not to be impolite - I'll *try* and spell it out again.
It wouldn't cost me a penny of my own money. That's the whole point of
crimminal law procedure - do you understand this basic point? Re-read and
try again if you don't.

>
>> - firstly it's a real breach of
>> privacy
>
>Oh, please. Addresses are public information. If he wrote it on a
>package....did he hide it when he took it to the post office so no one
>else would see it?

Addresses as public information. Not public for any *use*. There is specific
legislation and international law designed to prevent the electronic storage
and transmission of personal information - postal addresses *are* included
in this formulation. (Also read the above post by velcro_spy where he
describes his experience with net wierdos - it really is not responsible to
print a person's postal address without their permission.)

>> and secondly there are just too many bloody wierdos out there in net
>> land.
>
>And I believe we've found one...cruising the Atari8 news group....anyone
>who would sue someone for posting their address is weird. Again, anyone
>wanting an address can get it from MANY publicly available sources.
>
I'm a wierdo for objecting, as others have done in this thread, to printing
Geoff Wallis's address? At risk of overreacting to your pathetic snipes -
just look at the facts and *try* and think through the arguments. (Btw, not
suing (sic?) someone - a matter of the crimminal justice system doing it for
me. It isn't (just) a civil matter it's a *crimminal offence*. Sheesh.)

Here's an idiot's guide to the issues. Firstly there's the idea of consent -
you're address or telephone number does not appear in telephone directories
without your consent. My telephone number and address does not appear in my

telephone directory because I don't want it to. You know those mailshots and promo offers you get through the door - the ones with a little box to tick if you don't want to receive information from "carefully screened companies" well that's an example of consent. Anyway, the data protection laws relate specifically to electronic data and the storage/transmission of personal information precisely because there are unique risks.

The point is that if something went wrong and my address was printed it wouldn't be my business. (This is just too easy.)

I don't think that there are any online memory maps. I'm in the process of writing to Ian Chadwick re: Mapping the Atari in the hope that he may allow an ascii/html copy of his book.

You could try some of the inline Antic articles - there may be something there on fairly specific things like graphics and sound but, as far as I know, there isn't anything truly comprehensive like Mapping the Atari.

Well, Kenneth, when you consider that many of the posts in csa8 have
revolved around this thread and related ones, I guess we have a hot topic
going! There are those who respond "what for," when somebody mentions
development of Internet hardware for the 8-bits, as if all of us also own
PCs or Macs. I do, but one of my user groups consists of guys who only own
Atari 8-bits. They also own modems and haven't used them. Now that the
library system in our county is due to offer free Internet access to its
patrons, they're suddenly very interested. Suppose that's duplicated
around the country/world(?) a few times?

It may not be a big market, certainly not a profitable one, but at least
developers do have a target audience.

Add to that the stuff that seems to be happening in the CBM community, the
intellectual challenge of producing Internet software, etc., and you can
keep the spirit alive for years to come.

619. The history of the Atari 8-bit video

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-18 00:00:00 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <01bd241c$4d92ea40$LocalHost@pc001>
Source record: 66843

Over the past few days, I've been looking through some of my old Atari 8-bit archive material, and it suddenly struck me that what we all need is a single resource which we can keep forever containing pictures, magazine shots, game demonstrations, historical information, and anything else we can think of. The best way of doing this, I think, is to produce a video. Video is great because we can say something like 'in 1981 Atari released ...' and we can show pictures of it at the same time. Video is also great because we can record output directly from the Atari to show old or classic games being used.

Last year I produced a video of the AMS show in the UK, and I had a lot of fun doing that, and it worked very well, so I would have great fun doing the history of the Atari video.

Initially, I have to research it. I need all my facts straight. I know there's a lot of stuff on the net relating to historical events, and I will be using all that to try and piece everything together. I also have quite a bit of Atari 8-bit equipment and software myself, which I will use as part of the video. However, what I really would like are photographs/slides of any computer shows either from the US, UK or Europe in which the Atari features. I would particularly like these to be of shows from the early 80's, but more recent shows are great too. I have no photos at all from US shows, so these would be nice. Home videos/films recorded at any of these would be fantastic. I would also like photos of rare equipment (1450XLD etc.). I know there are some on the net, but the resolution is not high enough to transfer to video. Videos of such equipment being used would also be superb. Although I am in the UK, I have equipment which can play NTSC format VHS tapes, so there should be no problems.

The final video will be in PAL format, but I will make several master tapes, so one can be used to convert to NTSC.

I think this will be a great project, and the final result should be something all Atari 8-bit users can keep forever. At this early stage, I would like input from as many of you as possible. If you have any photos, or other archive material, please E-Mail me. If we all work together on this, we should have it done in no time.

620. MS-DOS Emulator for 8bit Atari

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-18 00:00:00 UTC
From: velcro_spy@webtv.net
Message-ID: <69t0v3hrn1@newsd-123.bryant.webtv.net>
Source record: 66844

This is a real good constructive group, for getting 8bit users the answers they need. I found out there's a hack to modify an Atari XF551 disk drive to "3.5 (but will it use the added capacity under standard OS) and that there is indeed an Atari basic compiler (ABC or Turbo) to speed up those old basic programs that we all did with the help of a runtime library.

So here's question #3: Wasn't there an MS-DOS emulator for the Atari 8bit computer which would actually run the crudest an oldest of MS-DOS programs on the Atari? I swear I've heard of it somewhere.

vs

I wrote to Atari User (UK) magazine with the same question about 10 years ago. I got a reply telling me that it wasn't feasible - that the 800/XL and Atari disk drive used too much specialised hardware for another disk drive to be compatible. I'm pretty sure that I saw advertised a mechanism which would allow XL users to use a "normal" disk dive with their computer - it was a long time ago though and I could be confusing it with a "use any tape unit" device. I'll have a look through my old mags and try and dig up the details but don't hold your breath.

Gareth Davies.

626. Re: MS-DOS Emulator for 8bit Atari

There was certainly one for the Atari ST - PC Ditto - but I've never heard of one for the 8 bits. Anyway, PC Ditto could only run the crudest (oldest) MS-Dos progs and even then at such a slow rate it was almost unusable so I suppose that an 8bit version would be even slower. The whole point of the MS Dos emu was that you could read, and therefore take advantage of, MS Dos format disks on an ST allowing you to, say, continue writing wp docs at home. As far as I'm aware there's no reliable way of reading MS-Dos format disks using an Atari 8 bit disk drive so the exercise would be pretty useless. Still, I've had a go at reading 8 bit disks on an MS-Dos machine using utilities without much luck - other people seem to have had some luck so maybe there is some mileage in the exercise.

Gareee,

For Bounty Bob Strikes Back download VSS (5200 emu, the latest version) from Dave's Classics at http://www.davesclassics.com The 5200 roms for Bounty Bob Strikes Back are also there and the good news is that it works (almost) perfectly!

I find the best Emu to be XL-it! although I couldn't really explain why - some of the game colours aren't as good as when using pokey (which also seems to run more games.) Still, short of paying for the newest copy of Rainbow it's the best there is. XL-it! also has a decentish dos GUI which has options for speed cripling etc.

Gareth Davies.

As> There are guys who will never buy a PC or Mac. Call them cheap, or
As> frugal, or scared, or whatever, but they are suddenly aware that an
As> Internet exists and they want to be able to access it with the
As> computers they now own.
As> I must confess that I use my PC for Internet access, but a good part
As> of what I get with my PC goes toward supporting the 8-bit community and
As> helping the guys in my user group.

I use my pc for 8 bit purposes as well, of course.
But also for things as M$ Access and so, and mainly for Internet access
and programming (programs for the 8bit on pc).
Still my point. 80286 machines are up for graps nowadays.
Use those machines for Internet access, 8 bit drive emulator (SIO2PC).
Why bother to write complex Internet program for the XL/XE machines,
which will probably work if a clever guy/girl writes it, but
will be slow, and won't support graphics, and other nice stuff,
which makes the web so attractive?

Better do the following. Have a user running a (PC) based bbs, access
the internet, download the Atari newsgroups, and make them available
to users through QWK. That way they can access the newsgroups WITH
there 8 bit machines. At least that is how I'm doing things here...

As> Just take the Pool Disk, which you and Ernest put together so well, as
As> an example. At the time that my group bought it, I was appointed its
As> custodian because at the time I was the only one with a PC that had a
As> CD-ROM drive and an SIO2PC. Two years later, the other guys are happy
As> that I keep putting programs from it into our newsletter. But even
As> though some of them now own new PCs, NOBODY has asked me how to get an
As> SIO2PC cable or to borrow the Pool Disk. They're happily dependent on
As> me for Pool Disk access, just as they're dependent on me for Internet
As> access.

We're currently working on Pooldisk II, release date around end of february
or so, due to the fact people actually have send us software, which we
will be putting on the CD...
We thing this CD (and other 8 bit CD's) help to stimulate the 8 bit community.
I normally have more fun hacking around on my 8-bit than in hacking around
in Gate$ his mind boggling hell.

As> All of this will change in the spring, when our public library system
As> is due to offer free internet access to patrons. I can't see these
As> guys going out and buying PCs. I can see them wanting to use their
As> Ataris for accessing this ng and for e-mail.

As> And then there's the Web. Why should they be left out of that?

Because the XL/XE won't support those HUGE pages.
But maybe I'm wrong here.

As> No, the people who want to write Internet software, up to and
As> including Web browsers for the Atari 8-bits or for any 6502 machines
As> won't get rich off the guys I described above. But why deny them the
As> challenge of writing such software even if the market is small?

Well, as long as people see it as a challenge, hobby, etc. I'm the last
one to subject against this, believe me. But people will normally expect
it to be the same as people who access it using a pc, and I just want to
say that will get disappointed there...
Netscape and Micro$oft put a lot of time, money and people on such projects,
and it still takes them months to deliver a browser. Think how long it will
take for 1 Atari programmer to do the same for an 8 bit machine...

As> So, we've identified two groups of admitted hobbyists who can at least
As> try to satisfy each other's needs.

As soon as it or 1 Internet program is ready, we will be happy to put
a pd, freeware or shareware version on our next CD...
Don't get me wrong here, I hope they succeed!!!
But I'm trying to be a realist here...
Maybe I shouldn't?

Bo.

Bob, with our venerable old Ataris getting older all the time, I've been painfully aware of how hard it is to keep a BBS running old the older equipment. Hardware failures and difficult backups make it hard to keep things going. I think that what we need is a PC version of PRO that has the same look and feel of the Atari version, and includes ATASCII emulation along with the ANSI and RIP that the PC users look for. Could we encourage Tom Hunt a,d possibly others to collaborate on such a project? I am willing to offer my services as a beta tester for it. What do you think?

Hi, i have an atari XEGS system that i am interested in trading for:

1. atari 8bit carts i need (sned list)
2. atari 2600 carts i need
3. tabletops/game and watches i need

i realize not everyone has stuff i need, so i will listen to cash offers
as well..

I have the XEGS base unit
keyboard attachment
power supply
missle command (built-in)
basic (built-in)
flight sim II cartridge
frogger game cartridge for 8bit
XE lightgun (i'm keeping this separate from the main system, so make
separate offers)
XE game, bug hunt (for lightgun)

I don't know anything about the Amdek drive but what I saw was a kit to convert the XF551 drive into a 3.5" drive using standard IBM components (and one or two new chips).

Gentlemen,

Bottom line here, for twenty five cents per name I can BUY addresses (mailing and E-Mail) from any one of several thousand perfectly legal and reputable sources. These numbers are gleaned from phone directories, public records, companies customer lists, etc. Yes, you can request that a businees you deal with not sell your address, However, at this time, there is NO LEGAL recourse if they do. The laws that are CURRENLY on the books in the UNITED STATES regarding limiting availablity of personal information pertain to personal medical, financial, etc. information. The only limiting law currently in effect is in regards to unwanted telephone communication (both voice and Fax). Even then the law prohibits using the telephone number to make unwanted contact, not selling it or giving it away. For example, If I buy John Doe's telephone number from someone, no laws are broken. I also have broken no laws if I make an unsolicited phone call to Mr. Doe to sell a product or service. If during that call John Doe tells me specifically not to call back, I'm legally prohibited from doing so for a period of 12 months. The federal fine for calling again within 12 months is $500. Of course, harrassment laws for repeated non-sales related calls would also apply.
.
Unsolicited FAXs are prohibited under all circumstances. The reasoning for this is that an unsolicted FAX wastes the recipients resources (FAX Paper).

With regards to physical mailings, there are no restrictions as long as the material sent is not objectionable by local community standards, is not illegal under federal or state statute, and no illegal threats or similar transgressions occur.

It may be that the U.K. or Europe have other laws. I don't deal overseas, and have no need or desire to make myself aware of their laws. Regardless, limits concerning recirprocity mean that they would have no effect here.

With specific regards to the posting of the address of Mr. Wallis, I don't think I would have done it, but then again I wasn't the one who felt wronged and wanted to protect the rest of the public from a similar fate. Had I done it, my concern would not have been the legality of posting the address, but whether I had sufficient evidence to protect myself from a libel suit based on the other content of the post. If I had sufficient evidence, then that wouldn't worry me either.

There was a Microsoft Basic II cartridge and disk. Which allowed one to use
old Microsoft BASIC programs. It was also suppose to convert Microsoft
BASIC programs written for other computers so that they would run on an
Atari 8-bit.

Not sure how good it is. I have it, but haven't really tried it out.

Millions of physical mail addresses are bought and sold also. I'm speculating here but, it seems to me that certain records are accessible to the public like property ownership, building permits, blueprints, and possibly property tax records - documents which may include your address and therefore make your address a matter of public record.

Regardless of what the law actually is regarding this, common sense indicates that there are too many laws designed to protect "dumb fuck" criminals and so many more people who are willing to do just that. I thought this phenomena was limited to the United States but, perhaps this stupidity has become a truly global event.

In my opinion you shouldn't be able sue somebody because they sold you hot coffee and you burned your lips or, sue the bike manufacturer because you got hit by a car and the bike didn't protect you from injury. But you should, if you know whereof a thief lives, be able to stand there and shout that information to all the suckers passing by without fear of arrest.

My theory is that theft is murder in small portions and should be treated accordingly. How I arrive at that is:

1. Time is money. It takes time from your life to earn money. Time you might have spent doing something else.

2. Life is of limited duration (time is life).

3. Algebraically then: money = time = life.

4. Murder = taking of all of a person's remaining life.

So, thieves are stealing money which is the same as time which is the same as life. The formula for theft is:

Theft = X/Murder. X being the amount of time it will take an individual to replace what was stolen and Murder being the unknown quantity of the individuals life which remains.

To make the calculation possible, Murder can be given the value A-a. "A" being average life expectancy in hours and "a" being the victims age in hours.

On the other side of the equation, X can be calculated as E/e. "E" being the amount of money needed to replace what was stolen and "e" being the amount the victim earns per hour less taxes "t".

Interesting thing here is the government may actually benefit from theft because the victim now has to work to earn money to replace the item that was stolen. The victim may take some overtime or sacrifice time off to recoup this loss. Time spent working and earning that may not have been spent otherwise and the product of which now becomes taxable.

Theft = (E/(e-t))/(A-a). This should yield a fraction which indicates the portion of murder inflicted through theft. Appropriate punishments can then be assigned to each interval. Say death penalty for 1/3 or above reflecting the victims ancient right to three fold damages.

The beauty of this approach is, it is takes into account the victims ability to earn and replace what was stolen. So, if a thief steals a 1990 Buick from a poor man, the thief's punishment will be much greater than if he steals the same from a rich man. This accuratly reflects the hardship worked on the individual victims.

Brek Brixius
Anybody wishing to use this theory, this document or portions of this document (excluding quotes from other posts) must notify and credit me.
To email me, get rid of "spa" and "me" and "not" and use what is left of my address. I worked hard on this and now my brain hurts and I still have to go to work. :-)

What do you mean, it's 'not compatible'? Unless I have some mutant
supercybernetic genetically engineered 64, it ran on my system just fine.
He's already done it. If you need proof, look at

http://www.tu-chemnitz.de/~fachat/8bit/osa/index.html

Version 1.3, the non-MMU version, does run on 64s.

Now, if you mean with the native operating system such that, say, Nether
became immediately and instantly networkable, the answer is yes, it's not
compatible. But that's not saying that it won't run on a 64.

yep - you have to set the target register before you output a screen,
but this can be done well before the end of the current screen. In fact,
it can be done (should be done) as a part of the LAST VBI since it sets
up the NEXT VBI. That way a critcal VBI will not dump the process,
assuming that the new screen control VBI code is not in the deferred VBI
(which is up to you).

sequence:

screen is being stored in video memory....

VBI occurs....

alter screen target register to new quadrant....

alter DL to point to new screen....

continue....

at the end of VBI, the new screen will now be stored in its designated
location in video memory. if you defer the VBI, the old screen gets
output into its proper location and you lose one frame update.

None of these hardware 80 column boards work in the XL or XEs. They are
only for the Atari 800. Other than some software attempts at making
unlegible text on a hi-res display there hasn't been anything done to
work a real 80-column display into the 8-bit architecture. The Tramiel-
produced XEpoopoo80 is shameful.

Compared to what Atari was used to spending on R&D the Amiga company's development was peanuts, especially considering the very large scale of the integration they were designing compared to what was available to the consumer.

[snippitty]

>Just to set the record straight....

>Personally I felt the Atari design elegant, advanced. Warner simply

< Sampling on Atari 8-Bit >
I have the Mirage 4-Bit A/D converter from (Mirage Poland), and the
STUDIO-MASTER sample program, and this program is able to sample and
re-produce good quality sound. It's pretty configurable, and
'high-quality' sample's will require some memory, so it's only running at
130XE Atari's or compatible...

You can compose your own 'MOD-file' in the program, but the format isn't
compatible, and the sample's are still only 4-bit, but the sample-rate is
high...

Sounds still amazing for only 4-bit sample's...

But MOD's can be replayed directly on the Atari 8-bitters also. The
Gatekeeper from the Netherlands coded such a player some years ago, and
it's working nice, however, when converting the MOD's to the MD8-format,
sound-quality will increase...

>(Snipping all the BS about me being afraid to write a SLIP protocol....)

>> So, trying to offer yet another hopelessly lame excuse why you
>> can't use his SLIP code like you said you could?

>I said I would use his SLIP
>code to write inet apps. Aren't you listing?

That's exactly what I said. Pay attention. First you're spouting
about how great TCP/IP is on the C64 then how easy it will be to
"lift out the SLIP code" and drop it into a C64 or Atari 8-bit.
Then suddenly you have to wait for him to finish the SLIP code.
So what is it? Is SLIP working or not? If so, then why do you
balk at using it after committing yourself to it earlier? If not,
then why lie about it being easy to port into any 8-bit? How can
you easily port something that isn't written?

>If I searched the Atari archives I'll bet I wouldn't see amy of your code.

And? I'm not the one running around saying, "Nothing stops me from
lifting the SLIP code out and using it as a program on the C64 with
its native OS, or using it as a program on the Atari with it's native
OS" and then later deciding that I can't do the work, because I have
to wait for someone else to write the SLIP code.

>Ok, weasel-boy, ball's in your court.

>Whattya gonna do, code chicken?

I'm not the one who promises coding miracles and then has
to wheedle his way out of doing the work.

>> and may now happily re-install Windows 95 on your PC.

>Really? Mr Gates would be laughing his rich ass off at you.

And? What does that matter? Tell me why you removed Bill Gates from
your PC and run linux instead? So, you think emulating the MS behaviour
of redundant software layers is intelligent programming on a 1-2Mhz
8-bit computer with 64K of RAM? Thank you for assuming you own all
our computers' resources.

>Even he's not crooked enough to label a serial driver as a layer of API.

I think you missed the fact that a JSR SendSerByte doesn't actually
do anything unless there's a SendSerByte to call. The method of writing
serial bytes out of a C64 and an Atari 8-bit are different. So, you
have your idea of handling bytes before the JSR SendSerByte which
probably isn't the way one or both of the 8-bits in question prefer it,
so the routine will have to translate whatever you're doing into the
way those computers do it. In either case, most of that 6502 code for
this SendSerByte on each platform is isn't even going to be similar.
So, how do you figure that "The same code runs on both machines with
only minor modifications" when SendSerByte requires a major overhaul
to implement on both platforms.

>By the way, throw away your Amiga's, you wouldn't be want to be
>using real API's like "Intuition" now, would you? Pinhead.

We're talking of your abuse of the 8-bit. Not the way faster computers
with (comparatively) humungous amounts of memory do things.

>> And, your vision of serial I/O on the computers would probably
>> prevent high-speed I/O from working on the Atari. Thank you

>That's the whole point of a driver, oh thick skulled one.

An extra bit of software blocking a program's use of the real driver
supplied by the OS is not a "driver". The Atari has one; use it.

Gee, but if you do, then that 6502 code won't be compatible with the
C64. You think maybe that's why the machines are different?

>>>Hardly "useless 6502's with 64K of RAM"

>No, I was refering to the routines that are already done in the
>6502 library. And these routines are usefull, maybe if you'd
>actually used one, you'd know that.

Useful to someone who thinks of their 8-bit as just a 6502 with
RAM. Hey, anyone out there get their 8-bit thinking graphics and
sound were irrelavent features? Yup, Noah and that hermit in the
corner.

The reason there is a c.s.a.8bit and a c.s.cbm is that these computers
are different. They have different features. Most people have the
8-bits they do, because the discriminate between the features they
want and the features they don't care about (in the other platform).
You're not going to find a big audience for a low-performance, bloated,
graphics/audio impaired compatability package.

6502 code written for the features of one will not run for the
other when the other lacks any comparable function. Period.
Look at the software base of both 8-bits and you'll see there's
almost nothing that does not use the unique feature of either
platform.

>> Yup. I figured you'd come up with some non-intensive routines
>> as an example of your supremely unparalleled thinking. Only

>I didn't come up with these, they're already in the library.

>> background support stuff. Just wait till you get to the stuff
>> that the majority of 8-bit users code for: graphics and sound.
>> That will be really funny.

>I already have that stuff, at least on the C64 and CoCo, big deal,

Not like there are a terribly large number of graphics options
between these two.

>if I want stunning graphics I'll go with a 2meg video card.

Oh? You can plug a 2M video card into the C64? We're discussing
6502 programming on the 8-bits.

>The idea is to push the machine to where it hasn't been before,

Running boring programs built of larger code with fewer features
slower than ever before is not where a lot of people want to go.
Someone needs to check Starship Noah into space dock and have him
overhauled.

>video and sound have been done to death on 8 bits, if I see another
>scrolling demo I'll vomit.

That's your opinion which I don't believe many will agree. Graphics
and sound are what people code for.

Gavin,

Actually the drives from Amdek with 3", not 3.5 disk drives and used disks that looked like minature 5.25" as opposed to the final 3.5" disks in hard plastic shells with sliding metal doors that at one point were selling for about $12.00 each when they were released.

>What pure nonsense. Ever heard about Unix or other cross-platform OS'es
>like, for example, CP/M ? Ever followed a course on structured programming ?

Someone has a useful implementation of unix running on the Atari 8-bits?
Noah is suggesting adding more code (that would not occur on either 8-bit)
to support his imaginary ideal of a uniform 6502 environment. The idea
of trying to make two inherently incompatible platforms run supposedly
common code will produce uninteresting programs that run slower than
anyone imagined. Basically, this idea is to design a neutral emulator
for both computers.

>> And, your vision of serial I/O on the computers would probably

>> You're funny.

>What _is_ a computer but a CPU with some RAM, IO and stuff ?

Graphics, audio, etc. You have the 8-bit that you do, because
you don't care a whit about the other hardware in the machine
other than the 6502, right?

>What
>_is_ an OS but some routines to do some basic stuff like operating
>devices and doing some internal organisation ?

It is the thing that lets you efficiently use the computer's
resources. And its one of the many things that make these
two 8-bits incompatible. And wrapping another layer of generic
code on top of it isn't going to improve performance, is it?

>> Yup. I figured you'd come up with some non-intensive routines
>> as an example of your supremely unparalleled thinking. Only
>> background support stuff. Just wait till you get to the stuff
>> that the majority of 8-bit users code for: graphics and sound.
>> That will be really funny.

>I don't see what graphics and sound have to do with a common interface
>for networking.

As soon as you write any code to support graphics (anything more than
a minimal text display) or sound on either platform, that code immediately
becomes non-portable between the 8-bits. I assume you agree a good
web browser would support graphics? Noah's bloated compatability
library and IP stack then become a performance and memory robbing liability.
The Atari 8-bit users would be better served by someone coding a TCP/IP
stack explicitly for the platform. Same goes for the C64 users.

That is the point I was making. It is not C64 compatible and porting
it to the C64 will be more than trivial and then porting it to the
Atari 8-bit will be tought still.

Unless we use Noah's handy-dandy generic software interface which
sucks up RAM and processing time and runs on Noah's generic platform
specs where we scrap all of our computer's unique features.

Well, I use an Amiga (for everything but inter-office mail and
news). It is more compatabile with my work which involves
unix programming. As far as the rest of the net is concerned
it looks like just another unix box.

>Even if one would have a SLIP connection
>with his XL/XE or other 6502 based machine, then what?

I'm not sure. TCP/IP is memory intensive. After it sucks
up all the memory there's not a lot left for user-interface
coding. The extremely limited SLIP being discussed only runs
on the C64 after you throw the OS away.

Synchronizing which 1/4 screen goes where could be a problem. There
might have to be some hardware register strobed every VBI to tell
the sampling hardware which of the 4 screens is being displayed next.

>interpretations comes out to 56 unique graphics displays. Granted,
>some aren't as useful as others, but then again why should you dictate
>to Atari users what kind of graphics they are allowed to operate?

>Now, you figure out how you're going to get Atari 6502 code using any
>of the possible graphics modes to run on the C64 with similar results
>and [quote] only minor modifications. [unquote]

Ok, he can't seem to manage that. Maybe the problem was coding
from scratch. How about a concrete example of actual source code?

Let's see if Noah can get some very simple 6502 code for the
Atari to work the same on the C64:

```
LDA #$A8
STA $D207
LDA #$84
STA $D206
```

Everyone will agree that the above is definitely 6502 code. If there
are any dissenting opinions I'd like to know. The example uses only 2
different opcodes and it runs uniformly on all Atari 8-bits producing
an obvious result. If it is true that "The same code runs on both

machines with only minor modifications" this should be very easy for Noah to port to the C64.

Noah, when you have it beat, tell us all how you implemented a fourth sound channel on the C64 using only minor modifications to the above 6502 code.

The fact is that these computers don't have much at all in common other than the 6502 and some RAM. Even at that, RAM usage isn't categorically compatible, because the OS on each decides that many sections are usable for only specific purposes. Any program that even touches on the many differences between the computers is likely to be impossible to port, because the other platform doesn't have a comparable feature implemented. The only way to imagine these computers "have so much in common" is to throw out the 90% of the computers' features that make them unique. Hence the reason why I say you're "gutting" the platforms.

Only after replacing the OS. At that point it isn't a C64 anymore and
as long as it is in that mode you're not going to get any C64 software
that calls an OS function to run on it. Hence, it looks like a C64, but
it isn't C64 compatible.

Bo, there's nothing wrong with being a realist. When I talk about 8-bits and the Web, remember that there's always the Lynx browser, available at some servers, which will allow browsing in text mode. Anyone with an 8-bit and a program that gives VT-100 emulation (there are several already) can use that. Graphics? Well, I don't know if the average 8-bitter will have a modem that even runs at 19.2Kbps, which is now the top speed for us. So, the World Wide Wait will be likely to give us all long gray beards!

But I know what challenges can do. I often read and download from alt.binaries.sounds.midi, and I find, almost on a daily basis, somebody asking for a utility to convert .WAV files to .MID files. The conventional wisdom is that it can't be done. But, more and more, I hear of some program being able to do it on a very limited basis. Given the hardware it would take, which is considerable, somebody is going to do it soon enough. And, yes, it will probably be done on a Wintel, which means that it will probably be bloatware of the highest degree. But eventually, it will work, it will be practical, users will be able to afford it, etc.

People who program for Atari 8-bits don't have much of a commercial market. They have to work within the restraints of the 8-bit. I'd say that their challenge is greater, and if they pull it off, they will really demonstrate their programming skills.

About Pool Disk II -- does it appear to have enough material for a double CD-ROM at this point? Can software still be sent? Every once in a while I run across something that might be useful and if I could sneak one more in, I'd like to.

They are collectors' items; I have personally never seen one. I
suspect the vast majority of 800s and 400s were made and sold with
GTIAs and that a large majority of CTIA machines were upgraded by
their owners.

It would probably not be too difficult from the pinout I've seen of the SID in some commie reference manual. You would need to generate a 1 Mhz clock signal for it.

I don't think it would be worth any real trouble to do---you would have to write all your own software for it. Considering it's easy to pick up a C64 series computer for next to nothing, and that oodles of software that exploits the SID fully has already been written for the 64, you might be better off just playing with a commie now and then if you want to fiddle with the SID.

Okay, my turn to provide obscure information. The ATR8000 was a sort of super 850 interface which would run CP/M programs and let you hook up other diskdrives than atari ones. It allowed for 80 column display with no mucking about with the atari's insides.

There was an add-on board for it that would let you run IBM-DOS on your Atari 8bit. I even found on the 'net a review of this from May 1984!

http://oak.oakland.edu/pub/cpm/atari/atr8000.txt

Now let's everyone rush to ferret out and purchase the last two remaining ones in existence!

I have seen a polish sysinfo program that makes tests for the SID, so someone
must have done this before.

Oh, no. That's not what I want. Using (commercial) software for producing sounds
on a C64? For this task my falcon should be the better machine.
I simply wanted to insert a SID into my 8bit and write some simple programs.

Ehm, isn't it true that there is some third party hardware that enables you to hook-up IDE equipment to your 8-bit Atari? If so, why not simply use LS-120 drives with LS-120 disks? They read & write most common 3.5" floppy disk formats, and also support the new 3M "SuperDisk" (what kind of a name is that?) format of 120MB/disk. It' s faster too.

I've had far too many computers in my time.
Countless Amigas (500s (still got one), 600s (still got two), 2000s (still got one) 3000 (primary computer), CDTV (primary CD player ;), CD32s (still got one))
Numerous Atari 800s and 65Xes (all sold now, sadly)
Seven or eight Apple IIIs (what's an Apple II ;)
More Ibm's and ibm clones than were made! (from 4.77 to 150Mhz)
Some macs
Lots of BBC B's and Masters
ZX81
Xerox cp/m thing wtih 8" drives
A few (four-ish) triumph adler alphatronics (p2 and p3)
Rare Black box
Some CBM 64's (still got one)
C16
CBM 64 games console
Oh, an Amstrad 464 as well.

Definately the best were the A3000, the 800XLs and the Amstrad PPCs (not cpc!!!)

It is NOT a criminal act to put someones address in a post if you are not doing it maliciously, and have cause. If it is not criminal, then it is civil. It costs you MONEY to file a civil suit, and you usually have to have a lawyer, or have intimate knowledge of the legal system. Remember, the defendant lives in the US, not UK, so he would have to be sued in US courts, so US law applies. Now, it would also cost him money to fly over here, stay in a hotel, eat etc. only to be LAUGHED OUT OF THE COUNTRY, that is unless he got an Oprah/Sally watching jury ;-)

> There is specific
> legislation and international law designed to prevent the electronic storage

You have a weird fixation with the concept of "OS" in reference to the 64.
By your definition, any program that kills the BASIC and/or Kernal "isn't
C64 compatible"--which means that an awful lot of programs are not 64
compatible. (many, many games leap instantly to mind.) GEOS itself would
not be "64 compatible" by your definition since it throws BASIC and the
Kernal away in favor of its own implementation.

Your assertions that in order to be worthwhile and respectible anything
(in this case a TCP stack) have to run under the BASIC interface are
nonsensical.

What, exactly, would you consider to be "running under the Atari OS", if
such a thing were to be implemented on the Atari 8-bit? That new menu
items be added to the MyDOS menu, like "ping", "traceroute", and so forth?

Bottom line, it doesn't matter how much of the 64's ROMs a TCP stack or
anything else throws away. It's still "64 compatible." Because who cares
at that point? Or are you saying that if I can't load and play Monopoly
in BASIC while a traceroute is being done it's somehow a lesser
implementation?

681. Cubase Audio for the Atari Falcon

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-19 00:00:00 UTC
From: mra125@psu.edu
Message-ID: <69vqqa$1kpm@r02n01.cac.psu.edu>
Source record: 66890

I'm looking to buy a relatively new version of Cubase Audio for the
Atari Falcon. If anyone knows of someone selling a used copy, will
you please post a follow-up here or email me at:
mra125@psu.edu

Thank you!

Mimi

Apart from the fact that 'a usefull implementation of Unix' has absolutely
nothing to do with programming models with a certain degree of abstraction,
I've seen a nice Un*x machine running on a 6502 with (granted) 512 K ram
lately.

> Noah is suggesting adding more code (that would not occur on either 8-bit)

Bwaaaah! Don't make me laugh! It's not that hard to write machine-
independant code (when you've got a common programming interface). I've
got numerous programs for my whole commodore-collection, and I don't
even doubt the fact that they will be quite easy to convert to Atari.
What on Zarks sake (Yes, I've been reading Hitch Hikers Guide to the Galaxy
lately!) is the difference between a call to a subroutine in your own
program and a call to a subroutine to a multi-platform interface !?

> Basically, this idea is to design a neutral emulator
> for both computers.
I don't feel any need at all to be able to play Atari-games on my
Commodore. Emulation is not the same as being able to port
wide-purpose programs quite easily.

<snip>

Ofcourse not; but I must admit that the availability of the 6502 does
a great deal. However, it's not the basic point. _many_ (mainly
I/O) problems might prove to be platform-independant.

If you'd program your 'additional' layer efficiently, I don't see any
reason why it shouldn't be.

No, I don't. A text based browser (like Lynx) is fine with me.

> Noah's bloated compatability

Coding a TCP/IP stack includes more than fiddling around with I/O chips.
It involves quite a lot of memory management, filtering usefull stuff etc.
that is what Noah means (IMHO). Ever heard of the OSI communications
standard ? Allthough the Transport layer will be different, a whole
part of the Network layer and the Application-layer will be transferrable.

A TCP stack is not a game. A TCP stack works (on every other platform)
as an extension to the system. Excluding this proprietary OSA65 thing
can you think of a computer that denies the use of its regular software
when the network stack is running? The PC? Amiga? Anything?

>GEOS itself would
>not be "64 compatible" by your definition since it throws BASIC and the
>Kernal away in favor of its own implementation.

Technically, yes. GEOS is another OS that happens to run on the
C64 hardware. If it won't allow you to run the existing base of
C64 programs then its not any different than the Apple OS on an
apple or the Atari OS on an Atari. Its not C64 compatible. That
there is some support for GEOS makes it more accepted/acceptable.

>Your assertions that in order to be worthwhile and respectible anything
>(in this case a TCP stack) have to run under the BASIC interface are
>nonsensical.

Not "anything". Games and other standalone programs are often
expected to do everything themselves or otherwise ignore the OS.
But a network stack is not a game.

On the C64 programmers are used to ignoring the OS, because there is
so little OS to ignore. On the Atari there is a mechanism defined
for adding devices to the system. Can you see any advantage in an
N: network device? You could open that from BASIC and use a couple
XIOs to set target connections. Get and Put bytes to it. The same
mechanism could work with any language on the Atari. If properly
constructed, a net device would work with *existing* Atari software
just like any other device.

>What, exactly, would you consider to be "running under the Atari OS", if
>such a thing were to be implemented on the Atari 8-bit? That new menu
>items be added to the MyDOS menu, like "ping", "traceroute", and so forth?

That like any other network stack running on any other platform it
exists peaceably with the rest of the computer. As a device or
some other program interface that doesn't forbid use of the Atari's
existing resources.

>Bottom line, it doesn't matter how much of the 64's ROMs a TCP stack or
>anything else throws away.

Well, that's apparently the definition of the C64 architecture. Just
another point that means the two computers have very little in common.

>It's still "64 compatible." Because who cares
>at that point? Or are you saying that if I can't load and play Monopoly

If it throws away the system to run then it is proprietary.
A proprietary net implementation may not go very far on the
Ataris.

>cpc!!!)

I don't collect; I generally use most of the stuff I have. So, I don't
have/never had so many different things.

Used to have an 800. Sold that.
Still have a 400. Has 48K. Used for games.
Have an 800XL. Upgraded to 256K RAM, Ramrod XL OS. Used for development.
Have another 800XL. Stock. Runs the games that don't work on the 400.
Jason's 1400XL is looking kinda appealing. I might try to get one for
hacking around on.

Had an Amiga 500. Sold that.
Had a 3000. Substantially upgraded. The USPS trashed it when I left Germany.
Have a 2000, 128M RAM, 68060, 2G HD, CD-ROM, network, and graphics cards.
That 2000 is my primary machine in the office.
Have a 3000, 18M, new chips, 3.1, 2G drive. Going to be set up at home.
Have another 3000 I just started upgrading to run an AD516 and DPS PAR.
Have another 2000 that's being upgraded. It will run the Toaster 4000 until
I get a 4000 Tower. After that I may add a Flyer.

I have a 1040ST. Bought it, a second floppy, and a color monitor from the
neighbor's gar(b)age sale for $40. It's the only thing that doesn't really
get used. It lives in a closet. The only thing I can think of doing with
it is use it as a dumb serial terminal if we need another one in the office.

If I ever get a Commodore 8-bit it would probably be a C128.

When Kassar stepped in ALL R&D stopped in-house and they went to outside companies, that in itself was a huge mistake, 1 for losing Jay Minor because they wouldn't continue developing new hardware and 2, they got into a cost cutting fight to keep up with the intro of the Vic 20 and C64's, however it would have been interesting to see if Warner had held onto Atari's computer and video games divisions if the MARIE chip from the 7800 would have been adapted to the XL series or used on a card for the 1090XL Parallel Bus Box. The Marie had 320X242 resolution, it was faster and had unlimited sprites and more colors, in general it was a 2nd generation Antic/GTIA combo chip.

Bob,

Would you care to enlighten us a bit about the Atari 7800 MARIE
chip? I know it runs at a max res of 320X242, but would it be possible
to adapt the MARIE to work in an Atari 8-bit? I'm assuming a new OS
rewrite would be necessary to talk with it? Think its possible or too
much work for too little.

Curt

I think people would line up at the door for any tcp/ip stack whatsoever.
Indeed I think people would be happy just to have a few active Atari
programmers, period.

You do a disservice to the Atari community.

Austin, you're right - this is getting silly. The final shot from me follows!

First you claimed that the address hadn't been printed. Now you seem to agree that it was.

Look, for what it's worth I sympathise with the fact that someone seems to have been ripped off here - had it happened to me I would print the offender's name here to warn other people. I really do understand the disappointment - something similar has happened to me. I was, in the first place, merely questioning whether or not it was good netiquette to print the address of the person: thus my comment about trouble with the ISP. Maybe ISPs in the US are different to ones in the UK - if I were to print someone's address I would lose my account pretty quickly. It's *really* bad netiquette.

I think someone else asked why it's necessary to hurt someone just because you've been hurt yourself - by printing their address. I was just asking the same question and pointing to what, through reading about a few cases, I believe is American law and what I *know* to be British law (Data Protection Act 1984) which does forbid the electronic transmission of personal information: postal addresses are specifically included in the Act. (I'm not a lawyer and don't own law journals but I'm pretty sure that the US has an equivalent of the Data Protection Acts. The key point is transmitting a postal address in *electronic data*. The law seems to be particularly precious about this.)

My point is that if someone trading with me had a gripe I'ld be pretty annoyed if they printed my address in a news group. Without wanting to repeat myself just read the post of velcro_fly who describes his experience with some of the nutters who frequent these groups. It is I think a valid point to object to posts which flame (maybe with good reason) and print a postal address. In fact precisely because zzyzx has a good point and a valid case some particularly sad people may well vent their anger on Geoff Wallis through snail mail and e-mail. This is the reality of net use and abuse.

In short I have sympathy for zzyzx - he spent a lot of money on the disks and doesn't seem to have got a fair deal.

I would however question *your* willingness to resort to personal attacks on me. After all it was zzyzx who invited the discussion (and zzyz who has been criticised for wasting bandwidth in posting jpg images of the packaging.) I'm 'wierd' for accepting the invitation just because I disagree with zzyzx's methods? How odd.

Gareth Davies.

It does when you're working with an Atari 8-bit computer that has a 64K
address space with about a third of it already occupied by the OS/DOS.

>I've seen a nice Un*x machine running on a 6502 with (granted) 512 K ram

512K RAM. You're helping proving my case about the results of "abstract
programming models" and multi-platform interfaces on 8-bit computers.
Will you be handing out free RAM upgrades with your programs?

>> He is suggesting adding more code (that would not occur on either 8-bit)

Right, it's not that hard, but it consumes more RAM and limits you to only
the functions that can be duplicated on all the platforms involved. The
result is slower programs with boring user interfaces.

>I've
>got numerous programs for my whole commodore-collection, and I don't
>even doubt the fact that they will be quite easy to convert to Atari.

Dull programs with a text user interface, no doubt. Nothing else in the
6502 realm could port very easily.

>What is the difference between a call to a subroutine in your own
>program and a call to a subroutine to a multi-platform interface?

A call to your own subroutine is just that. Your subroutine does what it
needs to the computer/special hardware/whatever and then leaves. A subroutine
efficiently written to use the existing resources of the 8-bit OS should not

entail much extra code. In other words, there should be little difference between the code the subroutine would execute vs the JSR itself being replaced with the actual code.

On the other hand, the multi-platform interface has to operate with an assumption of generic data handling that is likely not going to mesh well with the way the computer handles it. Every call to the interface requires the subroutine convert the generic data handling that's been assumed to what the computer actually needs before trying to manipulate the computer/special hardware/whatever. Then it has to convert the results back to whatever generic data handling is assumed by the multi-platform interface. (The Atari and C64 don't return the same error/success codes for I/O, do they?) Additional layers of code exist in both directions that do not exist in a subroutine written for the specific platform.

Generic, cross-platform coding makes a great subject for very thick books with a CD-ROM intended for 32-bit computers with megabytes of RAM and hard drive space. But these are 64K 8-bit computer we're talking. Buy me a memory upgrade and hard drive interface and I'll play along.

>> Basically, this idea is to design a neutral emulator for both computers.

>I don't feel any need at all to be able to play Atari-games on my Commodore.

I didn't say emulate the Atari. I said a neutral emulator. The code being discussed is basically an interface to equalize the lowest common denominator of functions existing on both computers. It is effectively a Neutral platform emulation that necessitates removing (ignoring) any feature that either computer includes which the other does not have. This amounts to ignoring the bulk of both computers.

>Emulation is not the same as being able to port wide-purpose
>programs quite easily.

You mean limited purpose programs, don't you? Anything other than generic data handling (which describes almost the entire software bases of the C64 and Atari 8-bits) isn't going to port easily (or port at all).

>>>What _is_ a computer but a CPU with some RAM, IO and stuff?

>I/O) problems might prove to be platform-independant.

Might. And probably does if C stdio is any indication. But it costs in terms of extra RAM use for more code layers and buys you lower performance. Neither the C64 or the Atari 8-bits have RAM and procesing time to waste. The difference between using stdio to read bytes out of a file vs using the actual OS functions to read the same file is dramatic. For fast computers you may not notice the difference unless the file

is large, but for slow computers (ours) the performance hit is noticeable.

>>>What _is_ an OS but some routines to do some basic stuff like operating

>If you'd program your 'additional' layer efficiently, I don't see any
>reason why it shouldn't be.

You mean that extra code can run without consuming CPU time? How long
has stdio been worked on for the various platforms? Nobody has figured
out how to make it use no processing time. It invariably brings reduced
performance to every program that uses it.

The 'additional' layer has to do a 'translation' of data into the function
and re-translate the results before exiting the function. This adds more
execution time. Performance is robbed. Even more so for things that have
to be called frequently.

[snip]

>>>I don't see what graphics and sound have to do with a common interface

>No, I don't. A text based browser (like Lynx) is fine with me.

Well, maybe for you. The discussion of a TCP stack started on c.s.a.8bit
some time ago with the question of how to implement graphics in a web browser.

However, a lot of pages that accommodate lynx browsers also assume an 80
column display otherwise you get a confusing mess. Now, coarse scroll the
C64 and Atari 800 40 column displays over 80 columns. This is no longer a
minimal text display. The methods used for coarse horizontal scrolling are
entirely different for both platforms. If you assume one or the other or use
a generic ideal instead, then you kill scrolling performance on one or both
computers and give yourself an infuriatingly slow screen update.

>> The bloated compatability
>> library and IP stack then become a performance and memory robbing liability.
>> The Atari 8-bit users would be better served by someone coding a TCP/IP
>> stack explicitly for the platform. Same goes for the C64 users.

>Coding a TCP/IP stack includes more than fiddling around with I/O chips.
>It involves quite a lot of memory management, filtering usefull stuff etc.
>_that_ is what Noah means (IMHO).

It also involves efficient I/O which doesn't happen with a generic interface layer. Also, memory usage is very different on both machines. A common scheme would either reduce both machines to areas of RAM that just happen to be common (which is probably too little RAM to be practical) OR it would necessitate throwing out the stuff that's using the RAM, namely the OS/DOS. Where the stack resides and how it uses RAM is another part that's best left coded explicitly for each platform.

>Ever heard of the OSI communications standard?

Yeah, that very nice and theoretical design that nobody has managed to follow in coding completely. Everyone takes shortcuts. i.e. Serial protocols that include packet framing for performance reasons.

>Although the Transport layer will be different, a whole
>part of the Network layer and the Application-layer will be transferrable.

Except for the highest application layer interface the code should be written specifically for each platform. Otherwise it is wasting RAM and processing time that isn't available on our tiny computers just to support an academic generic programming ideal. In other words, parts of the generic OSI model can function only if you have a lot of free memory and processing time to burn. We don't have it.

>>...Its not C64 compatible.

>Absolutely classic.

"C64" is a description of the entire computer; hardware, OS, RAM,
everything that this entails, not merely the label on the case. GEOS
is effectively a different operating system. GEOS runs GEOS programs.

If your pal doesn't have GEOS he's not going to be able to run a GEOS
program you give him, right? So, GEOS programs aren't compatible with
his C64, right? He has to first instal GEOS. Then he has a new, different
system.

Saying GEOS is C64 compatible is like saying a PC with DOS installed
can run linux programs just because both OSs can run on that CPU.
Since GEOS and the C64 are purposely targeted to the same hardware there
are a lot of similaries that they do share i.e. the differences aren't
quite as bad as the differences between PC DOS and unix.

>>mechanism could work with any language on the Atari. If properly
>>constructed, a net device would work with *existing* Atari software
>>just like any other device.

>Which software were you thinking of, specifically?

Any program that uses the CIO the way it is supposed to. i.e. just about
any programming language that currently exists for the Atari 8-bits could
be used to write programs that use the net.

Properly presented to the system, a NFS drive could be mounted that looks
just like any other disk. Any program that reads/writes files would work
just like this was a regular disk. In other words, just like the network
operates for any other computer.

>>If it throws away the system to run then it is proprietary.

>I think people would line up at the door for any tcp/ip stack whatsoever.
>Indeed I think people would be happy just to have a few active Atari
>programmers, period.

>You do a disservice to the Atari community.

I think not. It would be a disservice to the Atari community to allow to go unchallenged the C64 programming mentality of throwing away the OS whenever the programmer feels like it. TCP is supposed to be an additional system resource, not a system replacement.

Wow... You guys seem to have had quite a collection! I can't even remember all the computers I've had, but most of them weren't supported very long! (Dang the luck!) Here's my list (see if you remember these!):

Timex Sinclair 1000
Mattel Aquarius
Coleco Adam
C 64
C 64 SX
Amiga 2000
Apple IIe
IBM 8088
IBM 486/50
IBM P166+

Still have all of these! Everything from the Adam on, I surfed the local BBS scene in St. Louis on it! Yep, still have the 300 baud AdamLink modem for the old beast, and still print stuff on it from time to time. The Aquarius and the Timex have both been lost in various moves, but the rest of them are still hooked up and used on occasion! Nostalgia definately has a certain value to it, and unemulated just makes it that much sweeter! Sorry, though- No Ataris with Keyboards at anytime in my life. ;-)

Add to that list nearly every game system I could lay my hands on, and it's pretty sad! I've had the Fairchild, Atari, Intellivision, ColecoVision, Atari 5200, Nintendo, Sega Master System, Genesis, Snes, Jaguar, 3DO, Oddessy, GameBoy, Game Gear, Turbo Graphix 16, and more! Even sadder, I still have most of these!

Another Drunken Mick,
Murph

696. To list and address or not to

Newsgroup: comp.sys.atari.8bit

Hi all! I am really getting tired of this argument about posting someone's address as being legal or not. I'm not a lawyer, and I'm sure the rest of you aren't either. At least one of you _claims_ to have a so called lawyer friend or aquaintence whom you've consulted upon this subject. From my own common sense and armchair perspective combined with what knowledge of fact I do have or have heard, I tend to believe that posting someone's address is perfectly legal provided there is no incitement for crime to be stowed upon the addressee. If a person lists someone's address and tells a story about them, then as long as true statements are being made (note an opinion about someone that turns out to be untrue is still truth if it is stated as someone's opinion) and the address is considered generally available information (ie. public record would certainly count for this) then it's ok.

TO THOSE WHO INSIST THAT IT IS ILLEGAL (that means CRIMINAL) because they are just so smart, or they have the lawyer friend, please cite and include the statute(s) which clearly prove your position. If are asserting the existence of a law then please produce it or shut up.

THANK YOU.

> follows!

Ditto.

> First you claimed that the address hadn't been printed. Now you seem to
> agree that it was.

You are right, it was listed at the bottom of the post...and also on the jpg. I don't find where I said it wasn't posted, though there were two issues, the jpg and the address in the post. Both contained the address. I have only been arguing the etiquette, ethics and legality of posting a small jpg and the address.

> I think someone else asked why it's necessary to hurt someone just because
> you've been hurt yourself - by printing their address.

I just don't see this as 'hurting' (that is in the emotional sense) someone. His address is a fact. It certainly was a warning to others, which could certainly 'hurt' future business with the seller. If that is your meaning, then, I would say yes.

I have been scammed on the web, and I took it upon my self to post follow up posts to every item the person was attempting to sell...I also found about 30 other people who were scammed by the same person. He took prepayments for items he never had, and never sent the items... That was a fact, and he was a thief!

> ... which does forbid the electronic transmission of personal
> information: postal addresses are specifically included in the Act.

See www.switchboard.com and look up my name... The address will be electronically transmitted. It is NOT illegal by any stretch of the imagination in the US. Though you can contact the source and request it be removed...

> My point is that if someone trading with me had a gripe I'ld be pretty
> annoyed if they printed my address in a news group.

I agree, if they hadn't tried to work it out first.

> I would however question *your* willingness to resort to personal attacks on
> me.

I questioned your sense and position on the ethicacy and legality of posting an address. I am sorry they came across as personal attacks. My apologies.

> I'm 'wierd' for accepting the invitation just because I disagree with
> zzyzx's methods? How odd.

No, I thought you 'weird' for defending a position that I felt irrational and had no foundation. I personally do NOT like the idea that someone believes they can sue someone, and waste their time and money, for something I believe to be completely silly and irrelevant. It is insulting and offensive to me.

A bit of a story on my experience with a litigious schmuck... I made an offer to purchase a house. The next step is to agree on all the terms and execute (sign) a mutually agreed upon Purchase & Sale agreement. We could not agree on terms (the guy wanted me to put in the P&S that I would pay for his legal fees if I chose to sue him in regards to this deal...no matter who won in court, basically, I'd be suing my self, and paying two lawyers for their time. This was an unacceptable term.) so after 3 months of negotiation, I withdrew my offer.

What happened, is this schmuck sued me for $80,000 in civil court for 'Loss of Benefit of the Bargain'. That is NOT a legal term, it is something his lawyer made up to sound like I was a real villain.

It took one year, and cost me thousands in legal fees to just have this schmuck laughed out of court. The judge, once he read my brief and statements, stood up, shook his finger at this guy and his dip lawyer and told them 'if they didn't drop this suit, he would keep them in court until hell froze over'. Needless to say, they scurried away with their tail between their legs. I won, but I lost...

Like I said, I really hate frivolous litigation...and unfortunately, there is NO penalty for those who do it. You can sue anyone for anything...and if it's frivolous, too bad.

I hate personal injury lawyers too...there are some cases that are legit...but most are just plain bull. And there is no penalty for bringing a false case against someone.

Well, if we can't agree on ethics, I believe we can agree that the Atari is/was a great computer, since we both frequent this group...

Austin

From: ldetweil@csn.net
Message-ID: <6a0sji$8pl@teal.csn.net>
Source record: 66908

I have an 8bit 48k Atari 800, Atari XE 128k, Indus GT DD disk drive, 850 interface module, Percom AT88 DD disk drive, masses of programming manuals, languages, word processors, software, joysticks etc. all equipment is in good and complete working condition (all cables, adaptors, etc.). good for a young kid learning programming or word processing. some of the graphics chips (e.g. display lists, etc) on these computers have never been equalled even in modern computers as far as technical features.

if you would like to buy the whole thing or parts, please send me email. someone going after the whole thing would be much preferred but I'll work with what I can. (I definitely can't sell in pieces less than $20-$30)

thanks;

I do believe Amdek came out with a version of their 3.0" drive for the TRS-80. The disks for the Amdek drive are difficult to find. However, they use the same disks as some Amdek Word Processors (and some other manufacturers). I have an Amdek and have managed to come across about 10 disks in the last year or so. Some new, some used.

My 256k 800Xl sometimes boots to a solid green screen. The problem? The cartridge port! If I put a cartridge in, then remove it and reboot. it usually fixed the problem

I dont know if the ram upgrade is at fault, or the cartridge port is buggered up..

: I don't know.
: I know the XL/XE is a great machine, but Tramiel had to put
: all his efforts on the ST. IMHO the right choice.

Was it really? The ST was such a departure from the look and feel of the Atari 8-bits that Atari lost many users to the Amiga, and frustrated those who stuck to the Atari 8-bits only to face a lack of support from on high.

Atari surely had a larger 8-bit userbase for many years than its ST userbase, and yet that userbase was deliberately neglected.

Atari would have done better by giving its established 8-bit userbase a more compelling reason to either upgrade or stick with the 8-bit than estranging them and hoping for new users outside the Atari-faithful to buy the ST.

: The C=128 is a good example. It was a great 8-Bit-machine,
: but nobody cared, because there were the ST and the Amiga.

I think the better example would be the Apple IIGS. Apple knew they had some 8-bit maniacs out there who would not immediately buy Macs. The Apple IIGS was Apple's attempt to strain the II archetecture to the limit, and it's too bad that there was no similar attempt at 65816-based Atari or C= machine.

I think Atari wanted the Amiga to be 65816-based, which would have been better for backwards compatibility, but I can understand why the team wanted to stick to the 68000.

There was an updated Antic designed, only it's not compatible with the Atari. It's in the Amiga. The only thing the Amiga can't do that the Atari 8-bit can do is hardware text modes. In general the graphics and sound hardware is a superset of the Atari 8-bits.

: The 1090 bus might be more in the "pure Atari" spirit, but you'll be
: kept waiting while someone decides there is enough demand to warrant
: the time and money it will take to design and build the cards. With an
: existing bus, someone needs only decide the demand is there to do the
: software, as the hardware already exists.

Not only that, but existing PBI supercards like the MIO and BB would be rendered incompatible if expected to plug into a 1090XL. Both of them, I believe, assume that they will be the only PBI devices, which is why the BB won't operate with the modem and speech chip enabled on a 14xx series machine (both devices accessed via PBI address space).

If performance is necessary, the bus must be designed local to the CPU so that it is not limited by the 1.79mhz "chipram" bottleneck.

If the CPU is 14mhz, ISA would be too slow to maximize the potential throughput. Same would probably be true of the Apple II bus archetectures.

: I also agree with making at least standard 80-column text a standard
: feature, even if it was nothing more than monochrome (although

Hardware is the easy part. Software is the hard part. Give an Atari 8-bit a 16-bit CPU running real fast and you have the potential for a nice machine, but without a modern OS and apps, it's still a paperweight.

If you give it at least 640x480 256 colors and an ANSI C compiler you can port over Unix code. That's probably the only strategy that would work.

Otherwise all that power will go UNUSED.

Dear Programmer,

If you live in Orange County California and want to be a part of a
Shareware development group writing technologically advanced software,
I am looking for you.

The current project being worked on is an Atari 8-bit Emulator for Win32.

Member requirements:

1. Enjoy learning.
2. Be willing to work on your own, with a once a week group meeting.
3. At least 6 hours a week coding time for the project.
4. Know C/C++ (We are not teaching basic coding)
5. Familiar with Win32 programming. (Not a must).
6. Have own equipment to work on.

Groups can not be larger than 5 or 6 for a given project, thus I can not
accept all applicants.

If you are interested, please contact me at atrouw@etree.com or
atrouw@home.com for more info.

Arie Trouw

```
>> CTIA was the chip in the first 400s and 800s. Later (before
>> the XLs came out) GTIA was installed. Does anyone still have
>> a straight CTIA machine?
>

I have an 800XL that I bought from a friend when the memory chips in my old
one went bad. I was playing around in AtariBasic today, and noticed that I
couldn't access Graphics 9-15. I think this is because it is equipped with
a CTIA chip instead of GTIA, but I thought XLs were new enough to have the
new graphics chip. Also, it has all of those nice little bugs in the Basic
chip. It locks up sometimes when I am entering code, and 2^2 equals
3.999999996.
-Tom
```

711. Auction: Atari 8-Bit Assembler/Editor, AtariWriter, Magazines

January Auction - Update 4

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Thursday, January 29, 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges/manuals/magazines; $6.95 if package includes systems, modules, hardware, or more than 2 books. I'll pay any difference. Some items require actual shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClassicAuc@aol.com.

Nintendo 64 - Complete in Boxes
N1. Mario Kart 64 (complete with box/instructions, excellent condition) -$24.95 min

Atari 5200 Cartridges - New in Boxes
1. Keystone Kapers. New in box (unsealed) -$9.95 min

2. Zone Ranger. New in box (unsealed) -$9.95 min

Atari 5200 Single Cartridges
3. Astrochase (very good label) -$3.95 awwatkin
4. Ballblazer (excellent label) -$1.95 min
5. Berzerk (very good label) -$1.95 min

Europe was very different to the US. In the late 80's the ST was the 3rd best selling computer behind IBM & Compaq! Beat Apple and several other well known PC manufacturers.

This may be a lame way to do it, but what I did was take an original MegaImage (1,025 k, I believe) and delete all the files in it, leaving only the shell. Then I proceeded to fill it back up in a more orderly manner (i.e. alphabetically). If you would like, I can send you a copy of the empty Image, with I call SuperDisk.atr. And it does work, too. I've used it quite a bit. No problems yet. Of course, it doesn't have DOS on it, but I'm sure you could easily add your own to it if you need DOS on it.

The Memo Pad was just a thing to help someone get used to the Atari keyboard and editor without hurting anything. No "syntax error" or "bad command or filename" would occur. Once comfortable with the way the Atari editor worked, the old Basic cart or whatever could be plugged in.
It's funny, but I remember when VIC 20 computers first appeared in department stores and how customers would wonder what they were supposed to do with BASIC. "You mean I'm supposed to PROGRAM this thing? Yeah, right!" The masses were never interested in BASIC any more than they are interested in getting under the hood of the car.

>And I said, any program that opens files on devices the way they're
>supposed to, through CIO. In general terms this describes almost
>any program on the Atari that loads and saves data.

You have still failed to give a specific example, but...

If I understand you correctly, you are implying that -- presuming that the program you are running (the word processor or whatever) doesn't conflict with your network driver -- a major use of a tcp/ip stack, in particular on an 8-bit home computer, is to remotely mount a filesystem.

And this is what you have been expending so much effort trying to argue?

Continuing, Atari users could then use this for... what? Is there really a need (or even a use) of any kind for a remote filesystem on the Atari? Is there such a strong desire to not have to save word processor files on a floppy disk?

Well that seems awfully silly.

Clearly the vast majority of people who use tcp/ip, and in particular SLIP/PPP (which is really what we are talking about here), have never once used a remotely mounted filesystem, or cared whether they could use their word processor or assembler over a network connection.

On the plus side, now that I (think I) understand what you are trying to say, I can go spend some time doing something useful.

Oh, it wouldn't be much harder than making a Mac or Alpha system do
it--it just wouldn't be tolerably fast... Those multiple-hour load times
are a pain.

No... But Gryphon (the version of Windows to be used on the new Wallet
PCs) might be small enough to run on a machine with lots of extra RAM
added.

As> in a while I run across something that might be useful and if I could
As> sneak one more in, I'd like to.

We've got enough material to stuff 2 CD's (even more).
But that's because we probably have 1 CD full with Web pages.
We throw that in just for the fun of it. There are many Atarians who
don't have Web access (especially outside the US and Europe) and would
love to have a look at it. We can always throw some web pages away
(Jaguar or Lynx) and replace them by XL stuff. Everything is welcome.
We've received a lot, and the release date has shifted to the end
of Februari. We've received permission to scan the Mapping the Atari,
so that has to be done as well before that time. See if it will fit on
the CD...

Anyway, we're still on it.
Bo.

- ------ Captain Vic ------

You need ADIR by Ivan Makintosh
Also you need APE by Steven Tucker
Ape created the image, ADIR imports/exports files from other ATR's.
Although I just use ADIR to extract files not to import. I just
copied from the PC mirror of Ape to the mega image mounted under
Mydos.

Incidentally I used that size so that the Mega ATRs would fit on a
1.44 floppy

Well, what did you use to delete and add files to it? That would be more
useful to me. Did you use APE?

Okay, I'll look for those. I tried using ATREXTR to remove file from a
megaimage, but it didn't see or extract all the files. I'm attempting to
categorise the games according to ones that work, remakes of arcade games,
ones that I really like, and ones that are really stupid (Rescue of Blondell,
anyone?)

If you re-write the whole os, sure it would. as those little palmtop
things are far far more powerful than an atari800.

Okay, I've tried APE, and I see that I need to actually use my physical Atari to do it. My real Atari is still up in the closet -- I've been using Atari emulators. There doesn't seem to be any way to use APE in conjunction with an emulator, so it seems I'm out of luck unless someone writes a utility that will extract or add individual files from a MyDOS-sized ATR. Then again, I could try using an emulated MyDOS to add and remove files from an existing megaimage.

I think "port" is too strong a word about what happened to GEOS between platforms. Mainly because you can't share files between say, GEOS 64/128 with GEOWORKS on the PC.

I think this software was ported in name only.

Geoff!

Fine, you win. GEOS is merely a very large proprietary program loader
with a GUI for the purpose of running custom written programs conforming
to its API. (Which generally describes quite a few operating systems.)

>>>>mechanism could work with any language on the Atari. If properly
>>>>constructed, a net device would work with *existing* Atari software

The programming languages were an example, since most that I'm aware of use
CIO behind the I/O commands they provide. Continuing in the reading, the
next example is of a net device allowing NFS device handling as if it were
just another disk i.e. D:

> "If properly constructed, a net device would work with *existing*
> Atari software"

>with a strong emphasis on "existing". I was therefore wondering what
>existing Atari software were you thinking of, specifically, to use with

>the network device.

And I said, any program that opens files on devices the way they're
supposed to, through CIO. In general terms this describes almost
any program on the Atari that loads and saves data.

are those 1050 drives stock? I am looking for a dsdd
>drive.

You won't find any 2x sided 1050's unless you use flippy disks. 2x density
is available in several flavors. However since Bob made mention that these came
from a school, that's not a very good probability.

If you really must have dsdd then look for an xf551. Either 5 1/4", or 3
1/2. That will give you the dsdd if used with a Dos that supports that drive
configuration.

Well SWP used to sell the ATR8000 with a Co-Power-88 upgrade which would allow you to run a some MS-DOS programs on your Atari, otherwise you could run (with 64K) CP/M programs.

Atari had listed as one of future PBI expansion cards for the 1090XL an 8088 card, so IBM compatibility was available and would have been available from Atari itself.

If I recall correctly, the Marie is a sort of second-generation ANTIC
for the 2600's TIA, but I could be wrong.

I think Atari's plan was to come out with an expansion box for the
7800 that would make it into a second-generation 8-bit Atari computer.
Not too surprising that never happened.

Brent

743. How do you make a Megaimage?

I know of two compilers (even though there might be more). There's first the turbo basic compiler that puts turbo basic (a super set of atari basic, it's backwards compatible) into machine language. The output must be loaded from the runtime stack, it was not possible to create standalone binaries. It supported almost every instruction (except LIST, ENTER and such) and floating point but included a couple of bugs.

Secondly, there's the ABC basic compiler. It compiles atari basic (no turbo) to a pCode which is interpreted by a runtime library which is linked to the final binary. The run-time interpreter is rather fast, much faster than the actual basic interpreter. The bad part about it is that it supports only integers, no floating points. Anyways, this compiler has become very popular, as quite a lot of Microprose games have been written in basic and compiled with it (including F15, Solo Flight and many others). The main idea why to use compiled basic for games was that the pCode was not very readable and the copy protection could be hidden in the basic source. The compiler itself is written in basic, too, and compiled with itself. Should be possible to adapt this compiler to turbo basic by changing the source code a bit and by extending the pCode interpreter...

There's been a third basic compiler that supports floats, too, was able to compile atari basic only and to create binaries without the need for a runtime library (it was linked to the compiled code, obviously). I forgot its name, however... sigh.

So long,
Thomas

>
> vs

Velcro,
I've never heard of this one. What I have heard of are various methods
of reading MD-DOS disks. One of these uses the Happy Drive system and
WarpDOS. I've seen but never tried any of the software only ones. I
believe that the CSS Blackbox with enhancements can also do this, but
actually running PC software on the 8-bit... I don't think so. You
could, however, run some MS-BASIC programs using the Atari MS BASIC
Language Cart., but even that would be a minute selection of programs.
If someone knows of a mod that does this (run PC programs) I'd like to
see it in action. I seriously doubt that a stock 8-bit could do it. The
hardware and memory map are completely different.

Bryan,

Your idea is correct, just like the 850 autorun device load which gives the Atari OS R1: through R4: rs232c devices, N1: through N4: could be installed and used a SLIP devices, perhaps a modification of the R: could be done to introduce the SLIP protocol onto the serial ports. This should be possible, I think what we need to do is track down some ex-device programmers, anyone wanna see if Bob Puff may be interested in this, hey where Keith Ledbetter (somethink like that). (Tom Harker from ICD is "THE" hardware hacker, look at all the devices he's done for 8bit, ST and Jaguar, if someone could do it, I bet he could)

Tom,

check out http://www.atari.nu/1200xl.htm for a complete description of
how to install Atari 400/800 ROMs in a 1200XL by Brent Borghese.

Curt Vendel's site also has Bob Wolley's PBI upgrade, which shows you how
to install an XL/XE ROM so that you can still use the full 64K RAM and
even the HELP and F-keys. Bob Wolley even shows you how to install the
XL/XE BASIC chip so you can power up OPTION-key style :)

Have fun.

Graham

JS>I want to learn assembler. I need to learn more about the hardware
JS>though. I would appreciate any advice/info you can give me.

If you're looking for good sources of info about the Atari 8-bit hardware, and how to write assembler for it, you might want to try a few of these sources.

"The Atari System Reference Manual" is a text file that's been floating around for sometime now. There's a copy of it on many of the technically oriented, 8-bit Atari websites. It has very comprehensive details on almost every inch of the Atari 8-bit. It's a good alternative to books like "Mapping the Atari", or "De Re Atari", although having these are good if you can find them.

Also if you can find it, get "Assembly Language Programming for the Atari Computers" by Mark Chasin. It's such a small little book, but the information inside is worth it's weight in gold. It has lots of info on doing graphics and sound in assembly, plus an excellent section on accessing the CIO, and writting custom device drivers.

Other stuff that's good is the magazines Compute!, Analog, and ANTIC. Analog magazine had a whole series on assembly language programming on the 8-bit called Boot Camp. It went over tons of material on many different topics. Compute! also released a raft of excellent books on the topic of programming the Atari 8-bit.

The best place to find the old magazines, and books, are at Atari user group flea markets, library booksales, and garage/lawnsales. Also if there are some discount computer book stores in your area, you could dig around in them too.

Mostly commercial stuff no longer sold. Stuff like MMG, and ABC compilers
work with Atari Basic.

There's also Turbo BASIC which is freely available, but the compiled code
isn't a stand alone executable, it needs a runtime to be run first. It's
kind of a pain to have to run a runtime, and then guess what and where a
file is located. It also has trouble with Sparta DOS. The version patched
for Sparta DOS doesn't come with a compiler.

BASIC XE provides a way of speeding things up too, although it's not a
compile. Just some fancy tricks with memorizing what address each subroutine
is at.

I must not be being very clear. What existing code were you planning on
using? A program name, a code fragment, anything.

To put it another way: let's say this TCP/IP program didn't use the normal
super-advanced device system. What is the practical effect on programmers
or users?

I have a second, somewhat related question. When you install one of these
new drivers, where on the system does it reside? That is, is there a special
area of memory set aside for drivers, that normal programs never use?

>>The Atari community needs coders, not academics.
>
>Coders who understand interfacing to the system.

Unfortunately it doesn't seem to have much of either.

Actually that's half of the system ROMs. The other half is at $A000.
$0000-$03FF contains the important kernal variables/locations.

Most of the routines you listed are never used by a typical program.

>Note that this is a closed OS.

?

>Routines are accessed not by passing parameters

?

>but by jumping to physical routines.

Hmmmm... jumping to subroutines has never presented a major challenge to most
programmers that I know of.

>Any patches to the
>OS must be made by intercepting calls at the jump table.

Actually it works quite differently. Many routines are vectored through
memory locations beginning at $0300. This is why extending the system --
replacing load code, adding BASIC commands, changing the system interrupt --
is so simple.

761. Atari Equipment for sale.....

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-21 00:00:00 UTC
From: terry ortman <Use-Author-Address-Header@[127.1]>
Message-ID: <19980121.181412.7735.4.ortman3@juno.com>
Source record: 66697

ATARI Equipment, MUST SELL!!!

ATARI 400 Computer, 16K, with power supply, manual, and 2 joysticks, TV connector, original cost $599.00, Joysticks $19.95 each, asking $50.00 or best offer. These SELL AT Video 61 for $49.95 used.

ATARI 1027 Letter Quality Printer, New in Box, with ink rollers, manual, power supply, connecting cables, oil, original cost $399.95. Also have a non-working 1027, can be fixed at any Atari service center, both printers cost new $399.95 each, asking $100.00 for both of them. Again, these sell, each $49.95 at Video 61.

ATARI 1050 Disk Drive, works with any Atari 8-bit computer, in very good condition, like new, supports single and dual density modes, includes power supply, original cost $179.95, asking $75.00. These sell at Video 61 for $74.95, same price.

Data-Que Turbo-816 upgrade for Atari 8-bit, XL or XE series computers. Upgrades and replaces the 6502C in the computer with the 16-bit 65C816 CPU, can use Atari OS, or the NEW Turbo-OS included. Speeds up programs as much as 350% faster. The 65C816 processes 4 instructions per clock cycle (Only the new P6, 80686 Intel chip does that, besides this), as compared to the 6502 which processes one instruction per clock cycle. Original cost $249.95. Includes T816 assembler $75.00, Cross Developer for IBM $75.00, sevreal other Turbo 816 specific disks, valued at $25.00 each. Asking $250.00 for the entire package. These are not currently available anywhere else that I know of.

ATARI 800XL upgraded to 256K memory, will run most 130XE specific programs, already wired for Turbo-816 installation, just need to re-solder 3 jumpers, and plug in the Turbo-816 kit above. Original cost $189.95 for the 800XL, $79.95 for the Upgrade kit, $65.00 for the 256K DRAMs, asking $125.00. Video 61 sells the USED 64K model for $59.95.

Supra External 2400 Baud Modem, includes powewr supply, no manual, Hayes Compatible, requires 850/P:R:/ATR8000, asking $30.00

MUST SELL, will consider any reasonable offers on this equipment.

Send orders to:

STARFLEET SOFTWARE Company
1037 West Leafland Avenue
Decatur, Illinois 62522-1537

Will consider trading for a trak AT-D4 double sided disk drive NEED ONE BADLY someone has to have one, or a trak double-sided slave drive.
MAKE OFFERS!!

To order with Checks by Phone, please fill out the below and send it as mail to the SysOp or email to ortman3@juno.com

[
[
[Velcro,
[I've never heard of this one. What I have heard of are various
methods
[of reading MD-DOS disks. One of these uses the Happy Drive system and
[WarpDOS. I've seen but never tried any of the software only ones. I
[believe that the CSS Blackbox with enhancements can also do this, but
[actually running PC software on the 8-bit... I don't think so. You
[could, however, run some MS-BASIC programs using the Atari MS BASIC
[Language Cart., but even that would be a minute selection of
programs.
[If someone knows of a mod that does this (run PC programs) I'd
like to
[see it in action. I seriously doubt that a stock 8-bit could do it.
The
[hardware and memory map are completely different.

Okay, I've ended up using MyDOS to copy the various files into alphabetically categorised images (games-a.atr, games-b.atr, etc.) I'll probably end up using APE to make specifically sized ATRs to fit the final sizes. I can see already that the "S" archive is going to need to be much bigger than the others.

Was usable as a quick video title generator or to act as a video source

for those individuals who use a stereo VCR as a audio recorder.
(Ok I know that someone out there will flame on this but think about it.

6 hours of continious uninterupted audio or two hours at a responce
levels that rivals reel to reel recorders at 7.5 or 3.75 ips).

No hidden features that I was ever aware of, and yes that was the
intent.

Hey, I won't flame that. I routinely use HiFi VCRs as high quality audio sources. 6/2 hours of near CD quality audio on a $2.50 tape is not a bad deal if you ask me.

Of course, I didn't use notepad. I used that neato APX video title program. Remember that one? :)

> vs

This cannot be considered an emulation but for the functionality of
MS Dos (you know the look and feel of it) Sparta was the way.
Many early users who had both devices (No, not me) found that
when moving between PC and Atari using Sparta made things
easier.
But Sparta won't run the PC software, just the same kind of
command processor.

I mentioned this because a non-Atari user could easily mistake
an 8-bit with a TransKey built into a PC box connected to
an MIO or BB with HD's connected running Sparta as a Dos PC.
(Especially if they had the 3.5 upgrade inside as well with the
drive mechanism mounted as the box is normally configured.)

: the hood of the car.

Actually, a lot of the masses were really interested in BASIC which is why
all those computers had bookshelves nearby with literally dozens of books
waiting to teach it to them. That's why magazines used valuable paper
sending out type-in program after type-in program. (Or do you think they
wouldn't have rather sold advertising in that space?)

Besides which, BASIC in store displays allowed hooligans to place all
sorts of scrolling messages that the manufacturer never intended their
machine to be used for.

There is new player, Inertia 1.45, which plays 4channs mods without any
conversion. Well, it plays 8bit samples quality, if you have installed
Covox inside atari, in the other way it plays 4bits samples on pokey.
There is also Protracker which allows you to compose 4 chann mods on you
atari. Almost all effects are available, and these mods after transfer
on PC sounds as normal mods. Of course both programms need min. 128 kb.
If you have 576 kb. extented memory you can load every mod from PC or Amiga.

Oh you mean different memory banks right?

> The PIA actually does the bank switching.

The memory selection needs decoding circuity to avoid memoryconflicts.
If you didn't need any support chips then expansion would
be as simple as jumpers from PIA lines to the memory. Since more than
one PIA line can be activated at a time memory selection circuitry is
necessary. All I said was that it adds memory expansion.
So the answer is YES
Freddy supplies safe memory selection as well as preserving Antic.

I never stated that it was amazing,

By the way the 800 had slots to allow for more memory

>

If a product meets the users needs, make him/her happy, sells and
makes the company a profit. that sounds like a success to me regardless
of it being built in or not.

That depends on the type of projects you work on and corporate incomeBut
the "winning" is the result of the sucessful product. That requires both

good engineering and marketing. Yes you would want to keep the engineers

of sucessful development, but that isn't always possible.

Try reading the book "Soul of a New Machine" by Kidder
.

>

Your first point was that Atari should have taken over the Amiga
developmentYou yourself now understand why Jay Miner took his
development outside.
Warners mistake was envisioning that Atari would always be a successful
game
company. You could not have convinced those Warner execs to take on a
dangerously risky project of computer devlopment.
Amiga by Atari was a dream not to happen.

Get yourself a copy of "Zap the History of Atari" .

The business market is currently the home market too.

> The home market bought C64's like crazy, and
> they came with no service or support. IBM was ignoring the home
> sector,

Actually TV ads catered to the home user. Everyone understood Appleand
rhe success of their computers. Some of the users were bringing
systems to work to reduce their workload (and that is how micros entered

business first)
IBM ran an ad where two country gentlemen were sitting
on a porch rocking in their rocking chairs and one mentions that his
freind
so-and-so just bought a computer. The other said something about where
will he get it fixed and if he mails it how long will he wait. The first
replies that
he bought an IBM and they will drive out here to fix it!

I'm new to Atari emulation (I also have an Atari computer), so
I never heard of APE. I would definitely try this out.
Anyway, answering your second question, first I created the
empty shell of the Mega Image. Then I made copies of it. I am using
XL-It!, so what I did was, I put a normal DOS disk in Drive 1, I put
the empty Mega Image in Drive 2, and in Drives 3-8 I put in different
full MegaGame Images.
Then I simply copied files from Drive 3, for example, to Drive
2. Example: C [return] D3:SPINVADRS, D2:

I would also like to say thanks to Yogi for making all of
these games available. I doubt my old disks would even work anymore.
It's nice to know that these games will never disappear now!

Going through some new finds I ran across one of those nice Indus GT floppy drives. Of course, no PS..so I figured I'd just plug in the ol' standard atari brick and check it out. A quick flash of the led's later, I was scrambling to unplug the thing. Heh...anyone know what type of power supply these Indus drives take? :)

Thanks!

I would assume yes, as the joystick ports are the same. You wouldnt have the software for it, which was a quasi-decent paint program. The switch on the back allows it to emulate a joystick I think.

> buggered up..
---
are you getting the 'green screen' when you try to re-boot the system?
in other words, has the system been powered on and you want to boot it
again? what happens is that the memory does not reset the data stored in
it fast enough, particularly on the 256K and newer memory chips.
plugging in a cart and powering on will unconditionally boot the system.
pulling the cart and powering on will also.....

Bob

When the home computer market and the education market began to grow, the biggest trend in schools was to teach kids to program in BASIC. For many, it was a major flop. But parents pushed for it, and computer manufacturers obliged by including it with their machines.

Thanks. for the input. When you consider IBM's original entry you are
right.
Heath Zenith had a early "clone" even earlier (No IBM type bios yet)
but if we include the entry of Compaq (with a compatable bios) it cuts
the time
down. Just trying to stay on the high side of the discussion.

Please contine to put your two cents in as you see fit....

Pat.

-
---Shawn the Touched

Actually, yes, the limit is around 16 meg, or in actuality, $FFFF sectors. Since the 8 bit only uses 2 bytes for sector # that is why. I've dreamed of helping write/hack another DOS to get around this limitiation some how..... Seems all the Dos's for the 8 bit have this limit. Maybe it could use an unused byte somewhere as a flag, making the sector limit $FF FF FF..... Of course, no controller/drive supports this right now..... but it could

yogi

p.s. I thoguht of making an image of just crappy games also, but figured what I think is crappy others may not.

-
-Okay, I've tried APE, and I see that I need to actually use my physical Atari
-to do it. My real Atari is still up in the closet -- I've been using Atari
-emulators. There doesn't seem to be any way to use APE in conjunction with an
-emulator, so it seems I'm out of luck unless someone writes a utility that
-will extract or add individual files from a MyDOS-sized ATR. Then again, I
-could try using an emulated MyDOS to add and remove files from an existing
-megaimage.
-
---Shawn the Touched

I used pc xformer to copy the files from one image to another, and pressed scroll lock (or whatever runs it at full speed) and it screamed. I've very anal, I want the files to be on contiguous sectors. I'm funny that way. Of course, it makes for easier hacking if you just have to read in the next sector rather than look at the link

... which is exactly how you implement psuedodevices. A smart system traps OPEN, CLOSE, BSOUT/BSIN (sorry, I'm old school and use old mnemonics ;-), and watches for its device number, passing through requests to the default or previously defined routine that aren't for it. So you could make a fake device 7 by intercepting I/O calls sent to that device and doing your things with them. I've seen RAMDrives for the 64 that masquerade as psuedodevices (usually calling themselves device number 7 or 12).

You can stack such psuedodevices too. As long as the routines play nice and copy the vector and call it indirectly via JMP ($XXXX) instead of calling the original ROM routine (a bad idea anyway since revisions may have altered their location), the calls will just cascade through each other until true devices filter down to the OS level and are handled as usual.

So, the Atari scheme with N: isn't unique ... it just requires a little more work and setup on the 64. But it can be/has been done.

My guess as for why Andre developed his own OS for running SLIP is because the 64 isn't built for highspeed RS-232/userport connections. You need external hardware and interrupt routines for servicing it, and while again this has been done I'm sure it was easier for Andre just to write his own Kernal and at the same time add the extra general functionality he was after.

Yes, I discovered that after reading the APE docs.

>p.s. I thoguht of making an image of just crappy games also, but
>figured what I think is crappy others may not.
I also intended to segregate the games that are clones or straight ports of arcade games, most of which are available in the arcade emulators.

>I used pc xformer to copy the files from one image to another, and

>screamed. I've very anal, I want the files to be on contiguous
Okay, I'll have to try that one, too. It's a little difficult switching between the PC and Atari OS's on the fly and remembering the separate command structures...

I can't get these to run. I have a LOT of them and I'm dying to relive
the past!
I'm on a MAC with the Rainbow demo 1.4 version. I've ordered the complete
version
but still waiting for the file.

If I try and autotype them stll they don't work. I get the ROM's must be
8 or 16K message if I have them in ROM and a crash if they are in disk
format. The Games disk files work from
a site which I downloaded.

Anyone know what I'm doing wrong?

Much Thanks In Advance,

Jim

Source record: 66711

Do you want to share ONE Internet connection with the rest in your Family or office?
SYGATE is the software to do that.

With features like Dial-On-Demand, it will connect your LAN to the ISP if
and only if there is access from your LAN to the Internet.

It is easier to use than proxy servers in that it doesn't require the setup in
each and everyone of your applications running on your PCs.

Free download from www.sygate.com

With one phone line, one modem and one ISP account, everyone in your office
or family can access the Internet from their own machine.

It works for Analog, ISDN modem and Cable modems.

Hello,

I want to connect Atari's (800XL) parallel interface to 8bit-ISA-cards.
I already have an interface working (at least a little bit), yet I can't
handle ISA-waitstates correctly. I am currently using a Hercules card
that use waits. Has anybody got experience with such kind of hardware?
Where can I get an *exact* AT-Bus-Spec. (for free)? I know there is the
IEEE P996 spec., but I don't know where to get it.

All sorts of hints are welcome,

Roland

> Anyone wanting to help?

But what kind of player ? It'll play MIDI files with use of samples, or trough the MIDI out ? If you have MIDI connection in your atari, it's simply to play midi files on any keyboard.. There is midi secquencer which works in this way.

Jim,
One thing you should do (probably won't correct these problems, but
would make loading easier) is to rename the .BIN files to .EXE.
Hmmm... Have you tried these files on a real Atari? If they work there,
try a different DOS to boot with. Also try a different emulation mode
(800, 800XL or 130XE) all w/o BASIC installed. You could even try
booting the emulator (again NO BASIC/CARTS) with ONLY the game file.
(EX.: bdash.EXE). be sure the file has the .EXE as the extension.

Roland,
Try doing a search on "ISA bus specifications" or "ISA bus wait states"
in a WWW search engine.

Message-ID: <19980122130300.IAA02627@ladder02.news.aol.com>
Source record: 66717

January Auction - Update 6

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Thursday, January 29, 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges/manuals/magazines; $6.95 if package includes systems, modules, hardware, or more than 2 books. I'll pay any difference. Some items require actual shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClassicAuc@aol.com.

>intend to be witty, but to make a statement of fact.

>Would *you* seriously argue that GEOS 64 is not C-64 compatible? Across
>multiple postings?

I meant GEOS programs which was obvious from the context if you
continued reading. You do not run GEOS programs by themselves.
They require GEOS.

Simply for the sake of silence I will just agree with the opposing
point of view seemingly held by consensus: There's no difference
between the computer, the OS, and an application program; one may
change any of them to any degree and they will be perpetually
compatible with the others. GEOS programs run on the C64 using
a form of magic suggesting that linux x86 programs must also
run on a PC equipped with nothing more than DOS.

Is everybody happy now?

>>You'd want to write "N: device aware" stuff. The best way to put it
>>would be that you could communicate with it using existing code since
>>it uses the standard IO interface.

>I must not be being very clear. What existing code were you planning on
>using? A program name, a code fragment, anything.

Pick any program on the Atari that allows full device name specification
with the file name when loading or saving files. Then again, if the
net driver is patched into DOS, it would use a D: designation and work
with anything that assumes a floppy device.

>To put it another way: let's say this TCP/IP program didn't use the normal
>super-advanced device system. What is the practical effect on programmers
>or users?

No programs work with it. Until someone feels like writing one.

>I have a second, somewhat related question. When you install one of these
>new drivers, where on the system does it reside? That is, is there a special
>area of memory set aside for drivers, that normal programs never use?

From what I understand of the 850 interface it loads into memory
following DOS and modifies LOMEM appropriately. Alternatively, a
program could load into the end of RAM and adjust RAMTOP.

>>>The Atari community needs coders, not academics.

>>Coders who understand interfacing to the system.

>Unfortunately it doesn't seem to have much of either.

writes:

>Going through some new finds I ran across one of those nice Indus GT floppy
>drives. Of course, no PS..so I figured I'd just plug in the ol' standard
>atari brick and check it out. A quick flash of the led's later, I was
>scrambling to unplug the thing. Heh...anyone know what type of power supply
>these Indus drives take? :)

The supply that comes with the Indus GT carries a DataByte label, and is an
11.5-volt DC, 1.95 amp supply. A 12-volt DC supply rated at least 2 amps
should work just fine, just don't go over 12 volts.

Spammers and other obnoxious morons cheerfully ignored.

811. Re: Smooth scrolling tutorial?

Newsgroup: comp.sys.atari.8bit

813. Re: Smooth scrolling tutorial?

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-22 00:00:00 UTC
From: Wes Hinsley <wrh1@doc.ic.ac.uk>
Message-ID: <34C78EEF.41C67EA6@geocities.com>
Source record: 66722

> Just a quick question: I'm trying to write a game on my 800XL and since it's
> been such a long time since I last had a go I've forgotten everything I knew
> about smooth scrolling.

Ok, this will be REALLY rusty, but may be it will remind or inspire
someone to fill in my gaps!

POKE 54276,x and POKE 54277,Y - these are the horizontal and vertical
smooth scroll memory locations. They apply to lines of the display list
which are set with the respective horizontal and vertical smooth scroll
atrributes -

D=PEEK(560)+PEEK(561)*256 gets the address of the display list, and then
I think if you add 64 or 32, (or both) to a display list line, then the
horizontal and vertical smooth scroll attribute is added to that display
list line. Basically, you do 8 smooth scrolls, and then a coarse scroll
(i.e. replot the screen with the co-ordinates shifted by one), setting
the smooth scrollers to zero again.

There's also... you can set D+4 and D+5 (I think) - as these are
pointers to the address of screen memory. S=PEEK(D+3)+PEEK(D+4)*256 -
if you change these by multiples of the number of bytes used for one
line, then you can scroll vertically up and down through memory. I think
there are problems with this method though; you have to have your
scrolleable screen all mapped out in memory, for one. Finally, a really
simple, (and not THAT useful) smooth scroll can be done for GRAPHICS 0
text, by doing "POKE 622,255:GRAPHICS 0" - then try listing a long-ish
program. Slightly temporamental - didn't work for me in Turbo Basic, and
only works on XL/XEs I think.

Hope this is of some help, sorry it's a bit vague, and probably not that
accurate either! I think ATARI USER ran a series on Display Lists and
interrupts, in late 1985 (gee, it's that long ago now...) which covered
scrolling pretty well.

814. wtd: Circuit for 130XE

Newsgroup: comp.sys.atari.8bit

Source record: 66725

Hi, i have a 130XE system for sale. Works great and is in great cosmetic shape. It comes with the power supply and special Atari RF cable (it will use a regular RF, but this is the original one that came with it, has a funky box built inot the cord), comes with one atari style joystick and a suncom slikstik joystick. Also comes with an 810 power supply (untested) and SIO cable (i cant find the 810)

Anyway, $45 plus shipping..

Ted B

818. Diskcomm file format specifications

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-22 00:00:00 UTC
From: ernest@wxs.nl
Message-ID: <34c7d39d.1371380@news.wxs.nl>
Source record: 66727

I am trying to write down the specifications for the format of Diskcomm disk archive files. There are several utilities for the PC and other platforms to convert these DCM files into ATR files, or some other format. Since I am working on the Pooldisk II CD, (no, we did not fall asleep, we were just very very busy) I needed to convert a ton of Diskcomm files into ATR files. I found that the current utilities do not always convert the DCM files properly. I have written a new program that I think does work right. I might have made mistakes of course. But I think I have it figured out. I hope the program will be available at Umich soon. It is called DCM2ATR, a name that amongst all these conversion utilities was oddly enough not used before.

The reason I am still writing down the specifications for the Diskcomm file format is that some people seem to be convinced that the ATR format is something that cannot be used by people that are still using their Classic Atari without a PC to emulate peripherals. Looking through all posts of last year regarding Diskcomm and such, there has been a lot of discussion about this subject, but nobody seems to know the actual specifications for Diskcomm archives. Well, I think I do. At least, now I do, after about a month of research. That is one of the reasons (just one) why we did not release the Pooldisk II CD before Christmas. Oh well, we tried.

Now to the point of all this. When I have written down the specs, it will finally be possible to write a conversion tool that will take all the ATR's on our CD and convert them into DCM archive files. Well, that is, into files that we can actually expect to work properly on the real Classic Atari computers too. We will then be able to write the CD either in the Diskcomm or in the SIO2PC format. My question therefore is, are there some of you interested in an all DCM format CD? Please give us some feedback on this, or maybe we can start a discussion.

About the specs themselves, I have found that there are some peculiarities in Diskcomm. It uses some algorithms to decode a DCM file. Based on this, we could define this as being the specifications. However, when Diskcomm creates the DCM files, it does some specific things that just happen this way because of the way the sectors are processed when compressing the data. For instance,

Diskcomm compresses sectors in chunks of 18 sectors.
This can be seen in the DCM file, since you will encounter
a sector number at least every 18 sectors. However,
Diskcomm does not actually need this to decode the file.
So, should the specification state that there must be a
sector number included at least every 18 sectors, or
should we regard this as a quirk or peculiarity in the
program that happens to create these DCM files?
In this case, it is Diskcomm itself. Our converter program
should not need to add these extra sector numbers
if they are not needed. Comments anyone?

Also, for my research, does anyone have a copy of
one of the older versions of Diskcomm? Like versions
before 2.0 or so? Let me know, since we need this
for writing up specs that are compatible. Well, actually,
we would only need specs that are compatible with
version 3.2 of Diskcomm. But we are always interested
in PD/Freeware/Shareware software. Still collecting,
as long as we are not burning CD's yet.

Post replies here, or send me an E-mail, to ernest@wxs.nl
I will post the specs here when I am done writing them down.
They might be somewhat lengthy, but then again, so is this
post. Sorry about that.
Keep those XL's/XE's humming.

821. Atari 8-Bit Cd (ROM)

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-22 00:00:00 UTC
From: BobKlaas <bobkla19@sisna.com>
Message-ID: <34C82955.3D9AC7EE@sisna.com>
Source record: 66730

I have completed the first version of a U.S. version of a CD, has to be read by an IBM or compatable CD-Rom drive. It contains most of the Pool Disk CD items, with the exception
of SED and Atari St files. Atari 8-bit to me means just that. Pool Disk has IBM emulator
files that are on the disk..My price for the CD is $23.00 total shipped...There is over 555500
sectors of files compiling of ACE of Utah disk SPACE library, BBS Express! Professinal
user written utilities, D.Knauf D-Kutilities for the Black Box and Mio and several other files.

What I would like is input as to the next CD produced, what items related to the Atari
8-Bit would one like to see here? Example, Repair documetation, trial and error text
files over 10years? Upgrades new old ect?

Keep in mind I am open to receiving files from anyone to be included with credit to the
author ect. but establising a base contect has taken me a year to produce. The next CD
will not take that long and I will have an upgrade out within the next 2 month..March 1998

bob

822. Re: How do you make a Megaimage?

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-23 00:00:00 UTC
From: w-radish@inreach.com
Message-ID: <34c8d475.132551526@news.inreach.com>
Source record: 66731

I'm afraid something isn't working for me. I used APE to create a single density image that was twice the size of the 1-meg megaimages (16342 sectors), and followed the APE doc's instructions on reconfiguring the drive in MyDOS, but when I tried to format it, it gave me Error 132.

>with GEOWORKS on the PC.

Actually, PC/GEOS has nothing to do with GEOS on the 64. PC/GEOS was fantastic and if I had the choice, it would be a tough call between a Linux flavour and GEOS. It was that good. It ran on anything and had fantastic multitasking power even on a 16-bit processor. And if you dumped fonts, you could even run it without a hard drive, though I wouldn't have tried.

Now Windows CE is trying to jam this fantastic OS out of the pen market. It just goes to show you that marketing muscle beats sheer ingenuity every time.

>I think this software was ported in name only.

GEOS was intended to be a multisystem OS for 8-bits, although it only got as far as the Apple II, which was in perpetual development hell, and the 64, which it came out for first and the only system it really had success on. (NB! this is NOT PC/GEOS I'm discussing now.) In fact, the 64 version had hooks in it for Apple II filetypes, so I guess Berkeley was aiming for app cross-compatibility (and with practically identical processors, they might have pulled it off). But the A2 version never materialized. Quark Catalyst eventually filled in that void, and then GS/OS.

Presumably Wheels will take whatever was left of this idea out of the OS, as few people are even aware of it now.

>

.DCM or .DC3 are "zipped" files, used by Disk Communicator (3).
Get that programm (for the emu !) and hmm....
You can "unzip" the file with the emu then.

Or get a (PC) programm, which can convert .DCM/.DC3 into .ATR or .XFD...

828. History of the Atari 8-bit Video

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-23 00:00:00 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <01bd27fb$cd3acfa0$LocalHost@pc001>
Source record: 66737

About a week ago I posted an article about my History of the Atari 8-bit Video project. Very few people have responded to this, so I have re-posted the original article below. For people who wish to contact me about the project (offers of help, etc.), please use this new E-Mail address (for the video only): video@dgs.clara.net . On other matters, please use the usual E-Mail address: dgs@clara.net

Original posting:

Over the past few days, I've been looking through some of my old Atari 8-bit archive material, and it suddenly struck me that what we all need is a single resource which we can keep forever containing pictures, magazine shots, game demonstrations, historical information, and anything else we can think of. The best way of doing this, I think, is to produce a video. Video is great because we can say something like 'in 1981 Atari released ....' and we can show pictures of it at the same time. Video is also great because we can record output directly from the Atari to show old or classic games being used.

Last year I produced a video of the AMS show in the UK, and I had a lot of fun doing that, and it worked very well, so I would have great fun doing the history of the Atari video.

Initially, I have to research it. I need all my facts straight. I know there's a lot of stuff on the net relating to historical events, and I will be using all that to try and piece everything together. I also have quite a bit of Atari 8-bit equipment and software myself, which I will use as part of the video. However, what I really would like are photographs/slides of any computer shows either from the US, UK or Europe in which the Atari features. I would particularly like these to be of shows from the early 80's, but more recent shows are great too. I have no photos at all from US shows, so these would be nice. Home videos/films recorded at any of these would be fantastic. I would also like photos of rare equipment (1450XLD etc.). I know there are some on the net, but the resolution is not high enough to transfer to video. Videos of such equipment being used would also be superb. Although I am in the UK, I have equipment which can play NTSC format VHS tapes, so there should be no problems.

The final video will be in PAL format, but I will make several master tapes, so one can be used to convert to NTSC.

I think this will be a great project, and the final result should be something all Atari 8-bit users can keep forever. At this early stage, I would like input from as many of you as possible. If you have any photos, or other archive material, please E-Mail me. If we all work together on this, we should have it done in no time.

Dean Garraghty

The correct command sequence for config and format of a large HD image
mounted in drive 1 is:

O
1 (drive #)
N
Y
Y
16342 (total sectors)

I
1
Y

Works for me, 16342 sectors, 32684 sectors, etc.

I hate to be nitpicky, but I think this is somewhat misleading. The oldest piece of the Internet, ARPANet, did go on-line in 1969, but it only connected 4 college campuses, and only people doing government funded research could use it. One could not fairly describe that as an "internet". FTP and Telnet were not even created until around 1973. And the various components of TCP/IP evolved later in the 70's and early 80's. ARPANet adopted TCP/IP in 1983, and began using the term "internet" at that time to describe a project for inter-connecting the isolated public and private network systems that existed back then.

Around 1987, the NSF created a backbone that made it possible to provide access to a large number of these different systems for a large number of people in the U.S. This is the first year that one could say something akin to an "Internet" existed. Global connections to that backbone appeared rapidly. But still, it only ran at T1 speeds, and was far too slow and chaoticly organized for the general public to make much use of until around 1993. It was in 1993 that the biggest piece of what we now call the internet was upgraded to T3 speeds. And that same year, the InterNIC was created, helping to unify the various networks that were connected to the NSF backbone. I think for all intents and purposes that year marks the real birth of what most people call the "Internet". Interestingly, that's the same year that HTML was created.

The point being that when the Commodore PET machines were released there was no "internet". Just a bunch of government or business networks that were not inter-connected to any significant degree. There certainly weren't any ISPs ;)

No, no, no, no! PC/GEOS is a totally different Kernal and architecture.
The PC flavor is multitasking, has a ground-up separately developed kernal,
and multiple selectable UIs and application-layer interfaces. Including a
very good OSF/Motif clone, I might add.

The 8-bit versions do not multitask, have small kernals, different application
suites, and a single hardwired UI. About the only things they do share is
the name of the company, their name, and the fact that the system font on
both is called BSW (but looks different on each one). The Apple and 64 versions
are practically identical, but the PC version is wholly different.

Use them, and you'll see that they are totally unlike each other except the
name (and yes, that Berkeley developed each).

I am using a generic magnavox composite color monitor. It just has normal audio/video input jacks on the back, exactly like a vcr has. I made a cord that connects the 5-pin monitor out jack on the back of my 800xl into 2 rca jacks- one for audio and one for video, It works great.... The atari 8-bit faq tells which of the 5-pins carry the video and audio. I dont know if this procedure works on the 600xl or other models.

Does it only use 1 4-bit channel or does it use all 4 (which makes it
in fact a 6 bit player)? Also, what's the replay rate?

>There is also Protracker which allows you to compose 4 chann mods on you
>atari. Almost all effects are available, and these mods after transfer

I never came to doing all the effects (in fact I never implemented _any_
effect). I'm very curious how Inertia sounds. Where can I download it?

>on PC sounds as normal mods. Of course both programms need min. 128 kb.
>If you have 576 kb. extented memory you can load every mod from PC or Amiga.

ObCSA8: Lately I ran across a program called SidPlay. For those who don't
know, it's an MS-DOS program that plays C64 SID files through a soundblaster.
I was wondering if there's a program for the atari 8-bits that plays these
files. It shouldn't be that hard to code such a program considering the
capabilities of the SID chip.

My MOD-Player didn't use MD8 files (like all the Polish and German players did) but loaded MOD files directly (preferably through a SIO2PC connection directly from a PC's harddisk because of the size of most MOD files). It converted it on the fly to an internal format similair (sp?) to the MD8 structure though. BTW I suppose you meant decrease instead of increase.

From: arickett@kent.edu
Message-ID: <6ab4ak$u1b$1@usenet.kent.edu>
Source record: 66749

Well, after playing with lots of 8-bit emulators this past year, I finally got my hands on a real 800 XL with 1050 drive! I had an 800 for years that finally gave out, so it's nice to join the Atari world once again. I have a few questions that maybe someone can help me with:

1) I now have lots of ATR and EXE files on my PC hard drive. Is there a simple way to transfer them onto Atari floppies that can be read on the 1050? I noticed that A.P.E. can do this, but this program seems a bit more elaborate than what I need.

2) What's the best way to connect to the web using my 8-bit? I have a University account. Maybe instead of transferring files, could I just download them again right onto the 1050?

3) Is there a way to hook the 800 XL up to a TV by using the monitor jack and RCA phone inputs on the TV? I imagine this would improve picture quality, but does such a cable exist?

Thanks to anyone that can help me!

-Alex Ricketts

Hi. I saw the article originally and thought it sounded cool. I did
not respond because I was unaware of how I could help. I have lots of
8-bit stuff but not even close to everything. Unfortunately, my 8-bit
stuff is in boxes and I am unable to actually set up the hardware for
any purposes at this time due to spacial limitations and domestic
logistics (ahem I am being kind to my significant other, she'd kill me
if I tried to drag out 1 more computer right now). I can however get
some of my books, manuals, pamphlets, brochures etc out without too
much trouble. I do have a flatbed scanner connected to my PC. Is
there anything I can help you with that won't take manyears of my
time?

Let me know.

Ya, you just made an Indus door stop. They are DC and do not handle AC
well... I think they are compatible with the Atari 5200 power supply.

You need 80 col telecom. software (like IceT) and your internet
accountneeds to be a shell account. Typically shell accounts support
x-modem
or z-modem transfers (x-modem is very common)

> 3) Is there a way to hook the 800 XL up to a TV by using the monitor

Yes you need a monitor cable. (5 pin DIN plug one end and RCAjacks on
the other) Try B & C Computervisions or Best electronics.

Ju> And GEOS runs on that specific computer.
Ju> Your argument is academic, polemic, pointless, and totally
Ju> unconvincing to every single reader of this thread. Moreover, by being
Ju> so intransigent you are making yourself look extremely foolish to
Ju> hundreds if not thousands of people around the world. Why?

Wait a minute. You can NOT decide for me here. I agree with Kenneth here
totally. Without GEOS implemented, GEOS programs won't run. Like a
Windows program only runs, when Windows is installed. That windows
can be ported to other machines (see Windows NT on a MAC), but the
code is surely NOT the same. This makes it obvious that it is not easy
to write a general layer.

Of course, if some would write a specific GEOS OS for our Atari's, our
Atari would be able to run GEOS programs. But the code would have to
be Atari specific. I don't think GEOS can be copied from an Un*x machine,
installed on a C64 machine, and presto it runs. GEOS programs running
under GEOS can be probably easily ported. The same is true for JAVA.
Design a specific JAVA runtime system for your computer, and it will
all JAVA code which is available now.

TCP/IP however is not an engine. It's a protocol. You can not download your
PC's TCP/IP programs from you pc, place it on your Atari or C64 and
expect it to run, right?
Then again, you expect a TCP/IP driver developed for a C64 to be copied
to an Atari and have it run?
No, in this case you want another machine independent layer underneath
this TCP/IP driver. I think THIS is extremely foolish.
If I would want to have a TCP/IP protocol it should be designed for
my Atari. Nothing more, nothing less...

[snip]

>>You do a disservice to the Atari community.

>I think not.

Ju> I not only think so, I know so.
Ju> The Atari community needs coders, not academics.

The Atari community needs people with common sense.
Good programs are based on good designs.
Good designs are well thought off.
Academics are good thinkers.
Hence, we need coders, academics, critics, and users.
How can a bit of criticism be a disservice?
Show us wrong, and post the code.

Bo.

Assembly is the way to go if you get serious, but you can go a long
way in gaining speed in BASIC by PRINTing directly to the screen area.
I'm too rusty to remember the tricks for doing it, so check some of
those references that were suggested. The main idea is to create a
string the size of the video memory, redirect the screen to that area,
then manipulate the string with string-oriented commands. The results
appear "instantly" and can affect up to the whole screen. There are
many variations of the concept. You will give up PLOT/DRAWTO commands
in a hurry.

There are also improved and compilable BASICs out there like the
shareware TurboBASIC, but I couldn't tell you where to find them now.

A little irrelevant but maybe of some help:
In my e-mail software your address shows up correctly - the mj* is not part of the link. Spam software scans the whole message and so they'll have no problem picking up your address either. I had the same problem and since I was told about it I now receive hardly any spam at all.

>Ernest, may I suggest the obvious? Have you tried to contact Bob Puff?
Of course I sent him a prerelease of my program. I haven't heard of
him yet though. Maybe he is too busy to read E-mail.
Also, since some people suggested that DCM should be a standard
format as is ATR, if all emulators and such would have to support it,
we might ask these people and their users for an opinion. So, I
posted this just for that purpose.

>Re: storing files in Discomm format on the next Pool Disk -- somebody would
>still need a PC with a null-modem cable to take advantage of them.
That is what we told people that asked for a DCM format CD. And on
top of that, you still need a PC that will read the CD. However, some
people are currently working on writing a driver or program that will
let you read a CD on the 8bit with an IDE CD player. They are able
to read files, as far as I know.

>And what would you do with single files? Discomm wouldn't work with those.
> Are you dropping the single files from the next Pool Disk?
One reason we had single files was that there was no time left to put
them into ATR files. Another was that we wanted people to try and
access these files directly. We can still put all these files into
ATR images for the next CD. And thus also convert them over.
As a matter of fact, we did that for the Umich archives. And I am
doing this all over again with the current "version" of Umich.
Also, DCM archives of a single file are possible, since they are,
after all, compressed. So this is not a problem. We just would not
store DOS on these single file disks.

858. Auction - Lots of Atari 8-bit Items - Final Week!

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-24 00:00:00 UTC
From: classicauc@aol.com
Message-ID: <19980124134301.IAA05344@ladder02.news.aol.com>
Source record: 66765

January Auction - Update 8

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Thursday, January 29, 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges/manuals/magazines; $6.95 if package includes systems, modules, hardware, or more than 2 books. I'll pay any difference. Some items require actual shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClassicAuc@aol.com.

Nintendo 64 - Complete in Boxes

I was just trying to format an MFM drive with an Adaptec 4000a controller on a Black Box. I am going to be sending a Hard disk setup to a friend in Germany......however, during the format, I got a bunch of "Bad Sector Header" "Unable to reassign" messages....I havent got through the full format yet, as it seemed to take forever, finding bad sectors and reformating etc....my question is......is this a fatal error? IE it can't deal with a bad sector like this? Suggestions?

Seems to be that what's failing is not 8-bit computers, but the peripherals to which they are attached. Many PRO boards have been running 24/7 for many years with no computer problems. Hard drives, interfaces and adaptors are another story.

Have any PRO (or other) sysops attempted to run their BBSs using SIO2PC and/or A.P.E.? What were their experiences with such a setup?

Also, what are the chances that SCSI and/or IDE removable media can be successfully interfaced with 8-bits reliably enough to run a BBS?

863. Running .BIN Problems

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-24 00:00:00 UTC
From: radios@earthlink.net
Message-ID: <radios-2401981006250001@ip61.san-francisco2.ca.pub-ip.psi.net>
Source record: 66770

I finnally got the full Rainbow Emulation program for the MAC PPC but I
can't run ANY of my 100 or so .BIN files.
I've tried a lot of things. What should have worked was DOS 2.5 in drive
1 and the .BIN file in drive 2. Using 'L" for load just gives me an ERROR
170 each time and the program dosen't run. I've tried the file with the
.BIN extension, .ATR, .EXE, I've autotyped it to the appropriate size
disk, ie: greater than 16K and so on.

It's probably simple but its kickin' my ass.

Anyone able to lead me from the valley of the shadow of darkness? I'm
dying to run Threshold and Necromancer.

Thanks,

Jim

->supported by Bob Klaas and the latest release is up to v5.0 I believe...

Hmm...okay, I'll bite-how does the ST version "suck" compared to the 8-Bit
version? :)

->Why would an 8 bit owner go to equally obsolete equipment to run a BBS, if
->his current obsolete equipment is failing him?

I guess I'll have to disagree with this statement. By sheer virtue of age,
ST equipment would have an decided advantage. You can argue that ST equip.
is obsolete, but can you hook up an ultra SCSI 4.5 gig hard drive to an
8-Bit? Or run at modem speeds of 38400 or higher? What about CD-ROMs? I've
got 4.5 gigs of HD space and 10 CD's running on my 10 year old ST on BBS
Express! ST... ;-)

Note here I don't know if you can do the above with an 8-bit, I'm really
curious as to whether or not you can. (I'm constantly amazed by what can
be done!) Thanks in advance...

First as far as the Mortal part goes, you haven't met any 200 year old
men yet, have you?

As far as the second part Pac Man was a success Indiana Jones and ET
were both over
produced by Warner. They both lost Atari gobs of dough because they
never sold enough
to cover the production costs.

That really doesn't affect whether or not they might have had to scrap
copies of it after the collapse: in fact, it might make it -more- likely.
You'd want to keep a lot of copies of a best-selling game around in case
your planned endless stream of consumers wanted to buy them.

Message-ID: <mcurrent-2401981714370001@macmcurrent.library.carleton.edu>
Source record: 66775

Anybody here subscribed to the Classic Computers List?

The information I had was that it was moderated by
mailto:bill@booster.u.washington.edu (Bill Whitson), and there was a web page at
http://weber.u.washington.edu/~bcw/ccl.html .

The web address says it's moved to http://haliotis.bothell.washington.edu
but that site hasn't responded to me for a week.

And I'm told Bill hasn't reponded to e-mail requests to subscribe to his list.

Time to nuke it from the FAQ, or am I moving to quickly?

-Michael

> "computer" things.

Well Glenn, the first "tinkering" was actually done in Machine Code in
1975, (ALTAIR)
well before the home computer market blossemed. Yes, you couldn't run
you substantial
productivity applications then mainly because they simply had not been
written yet!
Having ANYTHING moving on a TV screen under your control was still a new
thing
because computers/video games in the home were not yet common. This was
history
and without it the present doesn't exist.

On a personal note, this "mortal" thing... Try watching less
Highlander.....

871. MidiTrack opinions?

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-24 00:00:00 UTC
From: chambera@cs.pdx.edu
Message-ID: <6aep7j$15a$1@sirius.cs.pdx.edu>
Source record: 66778

I'm thinking that MIDI sequencing on my 1200XL might be fun... Does anyone have any thoughts on the MidiTrack interfaces that B & C Computervisions sells? Do they come with software? What's the difference between the II and III models? Also, anyone using the "MidiPatch Casio CZ" disk B & C has? Am I right in thinking this is a patch librarian?

Any opinions appreciated as usual...

872. Shareware.com now includes Atari 8-bit!

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-24 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <6adhad$a0h$1@hades.csu.net>
Source record: 66779

http://shareware.com/ , c|net's FTP-site search engine, now includes
the Atari 8-bit files at UMich!

Unfortunately, being under the previously-existing "Atari" category,
the files are now pretty mixed in with the ST stuff. I've talked to them
about fixing that. No reponse yet (they're really slow that way)...

Anyway, so now you can use http://shareware.com/ to find Atari stuff..
just be careful what directory you pull it out of! :)

Remember, you can ALSO use MY MINI VERSION OF SHAREWARE.COM!....

XL Search, the Atari 8-bit FTP site search engine!
If anything, it's much less cluttered than Shareware.com! ;)

http://zippy.sonoma.edu/kendrick/nbs/xlsearch/

Enjoy!

-bill!

Tom Rosso (slmph@cc.usu.edu) wrote:
: Can somebody tell me the main differences between the languages Quick and
: Action. Which one is more powerful, easy to use, where can I obtain them,
: etc. Thanks for your help.
: -Tom

IMO, Quick is harder to use. It could be because I don't know 6502 Assembly,
but I also found that the 38-39 character limit on logical lines of code
was kind of crazy. I prefer Action!'s editor over almost every other editor
for any other platform that I've used! :) (emacs and MSWord <gulp!> are
actually pretty awesome, too!)

Quick is also disk-based, vs. the cartridge-access of Action!
I often use Action! as a fast little memo pad when I'm on the phone! :)
It boots up instantaniously (since I'm not booting DOS). I've even written
some code w/o booting to DOS, and then printed it through APE to a file
on my PC... an interesting way to save a file, if you ask me. :)

I'm not sure of Quick's limitation on buffers, but Action! has two.
It has search-and-replace, search, cut/paste (by lines), and compiles
pretty quickly.

What it DOESN'T offer (I may as well complain while I'm at it!) is easy
banked RAM access or 65c816 CPU support. I feel it should. I wish Mike
Hohman (FTe) would appear out of nowhere and do this for us. (He owns the
rights to Action! now, right?.. yeah, he does.. anyone remember Mars8?)

I'm not sure what built-ins Quick offers for banked RAM access. My GUESS
would be it does offer something...

I have the game AND the manual.

I've played the game a little bit, but it took too long (building
your space-ship etc.) before it got interesting and the disk accesses
where very slow. Also there was much disk swapping. Although I was
very interested in the game, I lost interest.
With the now-existing emulators, the disk swapping problem and the
access problems are resolved, but the game is a litte bit outdated
now....
However, nostalgia rules....and if I get bored of the actual games,
perhaps one day I'll try again to play UNIVERSE

The mortal Alan Sharkis wrote:
: When the home computer market and the education market began to grow, the
: biggest trend in schools was to teach kids to program in BASIC. For many,
: it was a major flop. But parents pushed for it, and computer manufacturers
: obliged by including it with their machines.

Given the limited memory of early computers, tinkering in basic was almost
all you could do with them. You couldn't run substantial productivity
applications on them. Back then even floppy drives were beyond the means
of most consumers. The novelty of having a computer back then meant being
able to watch it compute, not being able to use it for WYSIWYG DTP or
raytracing or web surfing as it is today. It was still a thrill to watch
a computer in action chomping on a BASIC program and doing rudimentary
"computer" things.

Made a nice score at one of the thrifts here today. This time, the find was a bunch of Atari programming books, 10 in all...

Awesome Games for Your Atari Computer -- Hal Renko/Sam Edwards
Games for your Atari Computer -- Paul Bunn
Compute!'s First Book of Atari
The Atari Assembler -- Don & Kurt Inman
The Best of Antic Volume One
101 Programming Surprises and Tricks
for Your Atari Computer -- David Heiserman
Atari Graphics and Arcade Game Design -- Jeffrey Stanton/Dan Pinal
Home Applications and Games for the
Atari Home Computers -- Timothy Banse
The A.N.A.L.O.G. Compendium
Games Ataris Play -- Hal Glicksman/Kent Simon

A pretty nice haul, and the best part is, each book was only 25 cents. Before today, the only Atari-related books I had were the Basic manual that came with the 800, the Atari DOS manual, and the owners manuals for some peripherals.

I guess this is a good start to my Atari library...

: ->supported by Bob Klaas and the latest release is up to v5.0 I believe...

: Hmm...okay, I'll bite-how does the ST version "suck" compared to the 8-Bit
: version? :)

Well, I am off to work in about 5 mins, so I don't have time to list
Pro!'s virtues......Bob? Perhaps a list of the features is in order. Let's
say briefly, that Express Pro has more commands and features.....I may
have not seen the latest and greatest version for the ST, but the version
I am a Sysop on local here, doesn't even come close to version 3 of Pro.

: ->Why would an 8 bit owner go to equally obsolete equipment to run a BBS, if
: ->his current obsolete equipment is failing him?

: I guess I'll have to disagree with this statement. By sheer virtue of age,
: ST equipment would have an decided advantage. You can argue that ST equip.
: is obsolete, but can you hook up an ultra SCSI 4.5 gig hard drive to an
: 8-Bit? Or run at modem speeds of 38400 or higher? What about CD-ROMs? I've
: got 4.5 gigs of HD space and 10 CD's running on my 10 year old ST on BBS
: Express! ST... ;-)
:
: Note here I don't know if you can do the above with an 8-bit, I'm really
: curious as to whether or not you can. (I'm constantly amazed by what can
: be done!) Thanks in advance...
:

Again, I don't have time. Suffice to say, that with parity disabled, or a
PAL chip mod on your Black Box, the 8 bit can indeed hook up a large
SCSI....although there needs to be a mod to allow for larger (than it
currently supports) heads and cylinders.....a Rom problem.......and, CD
Roms....well, people are working on that....until then, I think you could
use SIO 2 PC....

To summarize the last three exchanges:

Q: "I know you could use existing programs with it. What's one you would
actually want to use?"

A: "We could use existing programs with it!"

>>To put it another way: let's say this TCP/IP program didn't use the normal
>>super-advanced device system. What is the practical effect on programmers
>>or users?
>
>No programs work with it. Until someone feels like writing one.

So the practical effect is no different: there are no programs to use with
it until someone feels like writing some.

The key word here, of course, is "practical".

>>I have a second, somewhat related question. When you install one of these
>>new drivers, where on the system does it reside? That is, is there a special
>>area of memory set aside for drivers, that normal programs never use?

>
>From what I understand of the 850 interface it loads into memory
>following DOS and modifies LOMEM appropriately.

Which will work with BASIC.

>Alternatively, a program could load into the end of RAM and adjust RAMTOP.

And hope it -- memory, zero page variables, etc. -- doesn't get clobbered.

Let us summarize. First, a little context:

A long time ago, on a newsgroup far, far away, someone made the bright association that it shouldn't be too tough to port one of the C64 tcp/ip stacks or even something like OS/A65 over to the Atari.

Enter the intellectual elite. Heavens no, such a thing is unthinkable. You would throw away everything that is Atari. And besides, the advanced and sophisticated Atari is totally superior to the crude C64 [*laugh*]. I've never really used or programmed a C64, but here are a few weeks worth of Important Statistics and Cutting Insights.

Now, I'm just a practical man and don't know much about theoretical constructions. After all these weeks, there are still two possibilities offered:

1. Write a new driver from scratch which uses the CIO.
2. Port OS/A65 or some other 64 tcp/ip stack.

From a practical perspective:

Case 1 Case 2
------ ------
Existing programs can be used, but Existing OS/A65 programs can be used.
there are no programs to use.

Load the driver. Then load the Load the OS/A65. Then load the
application program. application program.

Driver is written from scratch. Major code is already written.

Programs must be aware of driver Programs must be aware of driver
program. program.

New applications must be written New applications must be written
to take advantage of driver. to take advantage of driver.

Try to find an Atari coder to Multiple coders could write apps.
write apps.

Probably won't happen. Might possibly happen.

And on and on and on. And the irony is that even if someone were to port OS/A65 there's no reason someone else couldn't do a CIO driver.

Ah well,

-S

I find no fault with BBS Express Pro, but the aging wquipment it runs on. Most of the time I feel like my BBS was being held together with chewing gum and bailing wire. <G> Even doing a simple backup was an all day affair for just one 16 meg partition. I'll never give up my Atari, but I want to serve it better with better equipment. Know what I mean?

The 8-bit version of Express is very similar to the ST version, but IMHO the
8-bit is MUCH better than the ST's Express. I had an ST for a few years, and it
was such a pain in the butt that I finally threw the bugger out. Nuff said.

Strangely enough, the Atari OS doesn't have a similar functionality
(at least, none that I've come across). The only things which are vectored
are the interrupts (and there are a bunch of them). It's one of those "As
long as you stay within this rigid framework, it's quite flexible" situations.

(No judgement in that statement -- it's just a different philosophy)

Yes! That's what I'm trying to say! The Peripherals!!! We need a new
interface that can hook up to newer scsi or ide drives, and perhaps a way to
use zip drives for backups!

888. And now, a sermon.

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-25 00:00:00 UTC
From: judd@merle.acns.nwu.edu
Message-ID: <6afnon$6cl@news.acns.nwu.edu>
Source record: 66597
Cross-posted to: comp.sys.cbm,comp.sys.atari.8bit

Lend me your eyes, brothers and sisters, for it is a somewhat disturbing trend about which I must speak.

Not long ago the the Atari and Commodore 8-bit folks got along quite well. They would visit each other's newsgroups. They would talk about games, code, and the other staples of the 8-bit computing world, united by a similar passion for their 8-bit computer. Few ever wasted any time thinking about how their computer was "better" -- most folks had the good sense to realize that the two computers were similar in practical functionality. And any fool with a modicum of experience knows full well the ways in which each machine can be quite superior to the other*.

Unfortunately a different sort of fool seems to be popping up once again: a self-appointed intelligentsia, which devotes considerable amounts of time to thinking about how and why one machine is totally superior to the other. And like any modern intelligentsia, their main claim to privileged insight comes from the fact that they adhere to a set of tenets that are posessed by people who believe they have privileged insight.

That is, the beliefs are not thought correct because of extensive experience, or knowledge, but because they are the beliefs of people "in the know." These are opinions formed not in the fresh air and sunshine of the real world but in the dark confines of the mind, fed not by fact and insight but by rumor and imagination, constantly reinforced by others of a similar mindset (you don't get very far in life by surrounding yourself with people who always agree with you).

The beliefs are generally declarative and almost always totally insecure -- any real challenge to them brings about a vehement and intransigent, not to mention lengthy, response; appeals to fact or reason are met by further fiats and bullying.

And in the end, of course, the entire community is diminished. A sense of discord begins to develop; far worse is that people in some way no longer take pleasure in an object for its own sake, but take pleasure instead that it is not another object, or take pleasure in diminishing others.

And thus we return to our fools, those fanatics who are not passionate about the computer for its own sake, but instead derive some perverse pleasure from the fact that it is "better" than another. Why do you love your computer? It's pretty pathetic if all you come up with is "because it isn't computer X" or "because it has this feature that other machines don't have."

Now, most 8-bit folks are decent people and have a lot of sense. They use the computer because they like it and get a lot of use out of it. And they are honest enough to admit the extent of their practical knowledge (or the lack thereof). And the fanatic usually gets zero credence within the community.

Unfortunately though there seems to be a small but growing set of ideas and beliefs going around which are being uncritically accepted. They get reinforced and spawn related ideas which are also uncritically accepted. And although it's (as usual) an awfully small group of people, there has been a perceptible increase in the amount of trash talk. Not technical talk, or valid analysis and criticism, but just plain old trash talk.

And therin lies the moral of this sermon. It doesn't go out to that handful of noisy fanatics, but to the rest of us: the normal 8-bit folks united by a passionate advocacy and love of their computer. The C64 and Atari communities have plenty to offer each other, and plenty in common. It would be a shame to see that spoiled just because of some irresponsible fanaticism.

evetS-

* As a fool with a modicum of experience, I would be happy to explain the ways in which one machine can be totally superior to the other to anyone who takes the time to email me.

889. Re: MidiTrack opinions?

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-25 00:00:00 UTC
From: Alan Sharkis <asharkis@erols.com>
Message-ID: <01bd29b4$5e4b7ee0$94c2accf@asharkis.erols.com>
Source record: 66598

A bunch of people will jump in here and state, not falsely, that MidiTrack interfaces are obsolete and that the software that's sold with them is horrible when compared to what's available for more powerful machines. If you've ever had experience with sequencers designed for PCs or Macs, or STs, or Amigas, you'd have to agree.

There are stringent limitations put on MidiTrack's concept by the video display facilities of the Atari 8-bit. There are more limitations imposed by the age of the product. What was important to Midi users when the software first came out are not necessarily important today (SPP is a good example) so the software is indeed cluttered with "features" that nobody uses any more.

I don't have the interface. I use the Wizztronics MidiMax interface, which doesn't have some of the described "features" of the MidiTrack. But again, many of these features are simply not in common use any more. (BTW, the MidiMax came with software that is even less convenient to use than MidiTrack, but offers more information on the screen at any one time.

Bearing all of this in mind, there are distinct advantages to the MidiTrack. First, if all you have is an Atari 8-bit, or you're one who likes to push it as far as it can go, MidiTrack will beat out buying a PC, Mac, ST, etc. and then installing the necessary interface cards (except on the ST, of course) and buying software to go with them. If you want to learn Midi from the ground up, the MidiTrack will fill you in on the basic concepts and the early history.

I'm really not sure about the MidiPatch Casio CZ disk, but I seem to recall that it is a patch librarian, perhaps also a patch editor. But Casio CZs are somewhat obsoleted by the General Midi standard, and certainly by its supersets (Roland GS and Yamaha XG.) That doesn't mean you can't write for the Casios, but it does mean that anyone who wants to use you sequences will have to do extensive remapping of voices and perhaps other Midi events.

When you get that many bad sectors while formating is a sign of a bad drive.
Try another drive .

I have 6 MFM and 1 SCSI all running at the same time.

Source record: 66605

MIDITRACK III is for the XE and supports much larger files.

The main problem with it is its proprietary disk format, imposed by the Forth programming language it was written in. It makes song management problematic. When I was experimenting with it I would save it to a Black Box Pseudofloppy which was very convenient.

It's pretty decent. Supports pitch bend and such, but it is pre-GM. When I did commercials I used a PC product called PowerTracks Pro and I liked that because it allowed me to assign GM reverb and chorus settings as well as stereo panning on the Roland sound module on a per-track basis and record mixer movements.

Works ok using APE, but if your using another emulator that
does not accept programming commands correctly, it might cause the
problem your having.

Thanks for the info, Alan. GM compatibility isn't that important to me as the only MIDI device I have right now is the CZ1000 (that's why I asked about the patch librarian disk). Another question, though: can the MidiTrack control more than one device at the same time? I'm thinking of getting a cheap drum machine like an Alesis SR16 or Boss DR550 and it would be cool to run both the CZ1000 and the drum machine from the Atari without plugging and unplugging cables. (If this is a dumb question, bear with me... I'm pretty much a complete beginner with MIDI.)

I have never formatted a HD on an 8bit with a Black Box, that had more
than a couple bad sectors. From the sounds of it, that HD is pretty much
toast.

If you are getting more than a few bad sectors, the HD will probably die
when you use it (if it ever formats completely!)

I would try to get another HD and try to format that.. if you get the same
problems, could most likely be a faulty controller....

That hard drive technology is pretty old now but you should be able to
find MFM technology at old electronic junk stores. :) <grin>

The Xl/XE machines can't run old carts like GORF, or Demon Attack, (unless
you have some translator software or 400/800 OS option in your machine)
But they are few, I think michael current created a list of games that ran
only on the 400/800 OS... I don't have the URL though.. sorry

on the flip side, most of the XE game cartridges are banked 64k carts. I
doubt you can get those to work on a 400/800 OS system. But you have to
remember the Atari 8bit line of machines are the most compatible computer
line in history. (if the code is written right it will run on everything
from an Atari 400 to a 1200XL to a 130XE...

Well, the N: scheme isn't intended as vectoring or system patch. Atari
people, please correct me, but I was under the impression that N: could be
configured as a psuedodevice and I/O to N: does through user-specified
handlers instead of the Kernal. (Is this correct?)

I just noticed your sig. I'm afraid I haven't been able to use APE at this time, since I'm not using my actual Atari. The CPU emulators have their own peripheral emulators. In fact, it was the APE documentation that I followed in my original attempts to format the large images (which I created in APE).

I prefer Atari 800 Win in terms of ease of use and features, but I have to use XL-It! for disk management, since the former doesn't write. I'm able to copy and delete files with few problems (I've gotten a few weird garbled listings after copying, but recopying them to another image gets rid of that problem.) If someone could create a blank image that's 3x the size of Yogi's megaimages, and either post it somewhere or e-mail it to me (I estimate about 3 megs?) then my problem would be solved, though it's a cumbersome workaround, I know.

Thanx to Yogi, I've regained a great deal of my original Atari collection. I still intend to do something to allow me to transfer some of my original works onto the HD, like my old original Movie Maker cartoons and my WP files (no luck finding Atariwriter+, though.)

I think that can be done. You "daisy chain" the devices. Of course,
having "thru" ports on them helps the process along, or you can buy a
"thru" box to do the same thing.

I just checked the docs, and I believe MidiTrack can send sysex messages,
so you should be OK on that score, as well.

913. Auction - Ends 1/29 - Atari Connection/Explorer/8-Bit Pgms/Hardware

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-26 00:00:00 UTC
From: classicauc@aol.com
Message-ID: <19980126125601.HAA18549@ladder01.news.aol.com>
Source record: 66622

January Auction - Update 10

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Thursday, January 29, 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges/manuals/magazines; $6.95 if package includes systems, modules, hardware, or more than 2 books. I'll pay any difference. Some items require actual shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClassicAuc@aol.com.

Roland,

You may want to speak with Bob Woolley rwoolley@pacbell.net he can put you
in touch with Michael St. Pierre who was working on the exact same project, I
would personally like to see your work, I too am working on the exact same type
interface, care to do some information xchange?

As an adventure fan I wondered if anyone knows whatever happened to Keith Campbell (adventure columinst of computer & video games) , who was responsible for introducing many of todays adventurers into the genre. Does anyone know his whereabouts or whether he is on the net anywhere. Also the Level 9 software house who did so much to advance adventuring in this country and abroard.

thanks

steveyoung@eclipse.co.uk

Alan Christie (94chrisv@scar.utoronto.ca) wrote:

: I have never formatted a HD on an 8bit with a Black Box, that had more
: than a couple bad sectors. From the sounds of it, that HD is pretty much
: toast.

I think most MFM drives will have a FEW bad sectors....it is very rare I
find one with none....the problem I am having is with "Bad Sector Header,
Unable to reassign" messages...

: If you are getting more than a few bad sectors, the HD will probably die
: when you use it (if it ever formats completely!)

IBM's can deal with a few bad sectors....

: I would try to get another HD and try to format that.. if you get the same
: problems, could most likely be a faulty controller....

The controller is fine....and if it wasnt, I have about a dozen to replace
it with.....the problem is trying to find perfect MFM drives....

: That hard drive technology is pretty old now but you should be able to
: find MFM technology at old electronic junk stores. :) <grin>

Ya, perhaps, but maybe someone with a bit of experience in writing
software could come up with better ways to deal with errors on these old
MFM drives.....it sure gets frustrating trying to get something going on
my 8 bit since my BBS drives died....(they just STOPPED one day....both of
them within a week of each other) :-(

>reicher6@pilot.msu.edu

There *are* cheats for Bounty Bob Strikes Back on Atari XL - I don't know about the 5200 version. That's the good news - the bad news is that I don't have them anymore. The codes were *not* activated through the codes menu - they were activated through key presses during the game. The shift, return and space keys were involved. Sorry, that's all I can remember.

Gareth.

Contrary to the other response, there are a few secret things in this game I know about. This is for the 5200 version so I'm not totally sure how it would work on the 800, though they should be the same.

(From the Best Electronics Catalog)

The programmer who wrote the "Bounty Bob Strikes Back" program for the 5200 and Atari 8 bit computer version put in the game some "Secret Messages" that are undocumented! To see these messages, when the first screen of Bounty Bob Strikes Back comes up, hit the * key on the 5200 numeric kwy pad. Move down the choices until you get to "Special codes." Using the CX52 joystick handle, move it toward the far left or right. You will see the numbers that start to increase from 1 to 65,000+. Enter the following numbers one at a time then hit the * key to see the "Secret Messages" 5, 6, 49, 69, 100, 213, 666, 782, 818, 2049, 6, 681 and so on. On Secret message #100, something interesting happens with Bounty Bob, He loses his hat and also gets a Hair Cut! let us know if you find any other "Secret Messages" or any other Bounty Bob game scenarios that change after you input a different number!

Not really any cheats per se, but has the potential to produce some. When you have a few years of free time on your hands, maybe you can systematically cycle through all the numbers and write down what each one does. In the meantime, good luck!

>handlers instead of the Kernal. (Is this correct?)

Adding a device to the Atari is done in a very natural way. There is
an adddress jump table starting at $031A. Each entry in the table contains
a device number and a pointer to a vector table. The table is searched
backwards until the correct device number is found, so you can replace
existing devices.

The vector table contains the addresses of i/o routines for that device:

Open
Close
Get byte
Put byte
Get stat
(special)
JMP init code (3 bytes)

So, to add a new device driver you write the necessary code and add the
addresses to the appropriate tables.

Channels are accessed via a little data structure called the input/output
control block. It's a 16-byte structure that contains things like
the handler identifier, the buffer address and length, and the
command:

Open $03
Close $0C
Get $07
Put $09
Input $05

```
Print $09
Status request $0D
Special >$0D (device specific command)
```

The downside? You have to fill out a data structure to do i/o. Compare

```
JSR GETIN
```

to

```
LDX #blah ;channel number*16
LDA #$07 ;GET
STA ICCOM,X
LDA #<BUFFER ;Where buffer is located
STA ICBAL,X
LDA #>BUFFER
STA ICBAH,X
LDA #<BUFLEN ;Buffer length
STA ICBLL,X
LDA #>BUFLEN
STA ICBLH,X
JSR $E456 ;CIOV handler
BPL :CONT
JMP ERROR
:CONT LDA BUFFER ;Character in .A
```

Note however that things like Input will read all chars into the buffer
(no get/store loops at your end).

>doing recently that has come to a grinding halt? That thread wasn't

I made no reference to the specific thread; as I said, it is a trend,
not a 'recent incident'.

>started to call 64 owners names, but to compare the machines and
>re-affirm why we choose Atari computers. All this talk about the
>machines being the same strips the Atari of its distinction. Now,

Nor did I (or anyone else, really) say anything about 'being the same'.
They are not.

One thing I did say was that there were a number of uninformed comments
being made and uncritically accepted. For example:

>although the Atari was technically superior.

And moreover that this was causing a fair amount of rancor among certain
individuals. For example:

>The 64 was a lot of computer for the money...not the best computer.
>Don't make Atari users affirm this forced equality.

I also implied that these types of comments are invariably made by people
without any practical technical knowledge of or experience with the particular
computer (in this case the 64).

Most 64 and Atari people can still argue and be friends, but some people
just have a real big cob up their butt over certain issues. The whole
point was that they shouldn't drag the community down with them.

928. [ANN] GeckOS/A65 operating system

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-27 00:00:00 UTC
From: Andre Fachat <fachat@vandyke.physik.tu-chemnitz.de>
Message-ID: <6ajctd$6j7$1@narses.hrz.tu-chemnitz.de>
Source record: 66637
Cross-posted to: comp.sys.cbm,comp.sys.atari.8bit,comp.sys.apple2.programmer

```
GeckOS/A65 Version 2.0.0-pre1
-----------------------------
(c) 1989-1998 A. fachat (fachat@physik.tu-chemnitz.de)
http://www.tu-chemnitz.de/~fachat/8bit/osa/v2.0/index.html

This is the release note for the GeckOS/A65 operating system for
6502 computers, version 2.0.0-pre1. This is a new major release
as the kernel has been partly rewritten, a complete new lib6502
implementation hsa been done and the o65 relocatable fileformat
is now supported, as well as multithreading.

Also a sophisticated "slipd" daemon supports internet connectivity
by using a SLIP connection, with a telnetd, a WWW server and related
programs. The lib6502 network connectivity is supported, although
this seems to be the only buggy part left...

What's new:

- major kernel rewrite:
much improved speed, now supports threads and task priorites.
Signals are now unix-like (they even can interrupt blocking
system calls :-)

- much improved porting ability:
_all_ system dependend stuff has been moved to a directory
in an "arch" subdirectory. Currently there are
"arch/csa65", "arch/gecko" and "arch/c64" subdirectories
(waiting for more contributions, hint, hint!)

- better kernel doc in "doc/kernel.html"

- lib6502 implementation

- dynamic memory management with lib6502

- relocatable fileformat

- telnet in and out from OS/A65

- stable WWW server (built into slipd daemon)

What's still to do:

- Only the C64 is working. Although the Gecko should also run,
I have not tested it. The CS/A65 is not tested and probably needs
more work.

What do I want from you:
```

- Comments on the general kernel interface
(or even kernel design, if you like)

- new ports!
If you want to port the kernel to a new system without
real memory management, it's almost only copying two files,
editing one of them and then writing the device drivers.
Taking the existing C64 stuff, that shouldn't be difficult.

Testing has been done on the VICE C64 emulator
(http://www.tu-chemnitz.de/~fachat/vice/vice.html)

Any comments welcome!

Thanks!
Andre

Might be simpler to get the connector info for each machine (the
joystick connections
are the same but the placement of things like +5v could be different)
and modify a joystick
extension cable as an adapter....

-wrote:
-
->> I've done that very sequence, but nevertheless it hasn't worked -I just noticed your sig. I'm afraid I haven't been able to use APE at this
-time, since I'm not using my actual Atari. The CPU emulators have their own
-peripheral emulators. In fact, it was the APE documentation that I followed
-in my original attempts to format the large images (which I created in APE).
-
-I prefer Atari 800 Win in terms of ease of use and features, but I have to use
-XL-It! for disk management, since the former doesn't write. I'm able to copy
-and delete files with few problems (I've gotten a few weird garbled listings
-after copying, but recopying them to another image gets rid of that problem.)
-If someone could create a blank image that's 3x the size of Yogi's megaimages,
-and either post it somewhere or e-mail it to me (I estimate about 3 megs?)
-then my problem would be solved, though it's a cumbersome workaround, I know.
-
-

Actually, a 3 MB megaimage would be about 10k zipped
As long as it was blank, of course!

ISTR that after a fairly dismal attempt at graphic adventures, they
stopped publishing and are now a development house for other companies. I
believe they still exist in this guise.

> capabilities of the SID chip.
The easiest way, is to install SID into atari. Then, you have
only to load files from c64. There are players, which plays c64 msx on
atari, but i haven't them, 'cause i haven't also SID upgrade...
But there are some players anyway, which play c64's msx on pokey.
You can hear them in Hard's demos. They wrote a kind of SID emulation.

well actually, i don't exactly know if it is a c64 koala pad.
The connector resembles a DIP, and definitely not a 9-pin joystick
connector. So, I either need the pinout for this thing or the pinout
of the internal board.

d Gorgon Rescue the Golden Fleece with Jason,
beware Medusa, beware this game... it's
Booorrrrriiiinnnggggg.

**KeyPunch Software

d Strategy Simulations Robot Patrol, Star Merchant, Civil War,
Convoy. Sure sounds like public domain
games to me ! In plastic sleeve.

**Learning Company

d Word Spinner Basic building blocks of reading, ages
6 - 10. In cardboard folder.

**Main Street Publishing

d Ardy the Aardvark Same game as above, repackaged in
ziplock.

**Penguin Software

d The Quest Fairly decent graphic adventure game

**Scholastic

d Agent USA Educational puzzle solving adventure
for ages 9 to adult. Nice, but heavy
packaging.

d Turtle Tracks LOGO-type graphics language program
for ages 9 to adults. Also nicely but
heavily packaged.

**Sirius

d Blade of Blackpool Illustrated myth and magic graphics
adventure game. Not bad.

d Fast Eddie Jumpman, Donkey Kong type arcade game.

d Wayout Colorful elaborate maze game. Still
has the CLOWN glasses !!

**Spinnaker (Heavy plastic box packaging...nice, but probably
expensive to mail !)

d Kinder Comp Collection of six educational games.
Boy, are your kids going to be smart !!

d Snooper Troops, Case #1 Kids detective game. Teaches problem
solving, deductive skills

d Snooper Troops, Case #2 Are your kids skilled yet? If not, try
this one too.

**Thorn EMI

d Home Financial Management If you buy all the above, this will
help tell you how much over budget you
are!!

**Walt Disney PC Software

d Mickey & the Great Outdoors If your kid can only learn from a
mouse, this is the one to do it.
More math and literacy skills.
By the way,
BOYCOTT DISNEY/ABC !!!

Cartridges

**Atari

c Centipede Zap the worm and all his parts. Arcade
game.

c E.T. Phone Home Help E.T. find the parts to make
his phone.

c Missile Command Save your cities from alien attack.

c Star Raiders Some more stupid spaceships!

**Imagic

c Atlantis Missile Command under water.

c Demon Attack Space Invaders with flapping wings.

**Spinnaker (once again, nice but heavy premium plastic packaging)

c Fraction Fever Shouldn't 98.6 be 98 3/5 ?

c Story Machine Kind of a "mad lib" for your kids.

**Thorn EMI (Once again, neat little BETA boxes)

c Kickback A soccer-like breakthru game.
Did I mention soccer is like unto
great gasping intakes of air!

c Jumbo Jet Pilot Take your seat at the controls of
a jumbo jet. Fly it upside down...
see passengers grab for Gravol...
mess up the President's $200 haircut..
console Bobby because they shot his
dog before boarding.... JUST KIDDING!

OK! I KNOW A SMALLER PERCENT OF OUR POPULATION IS LITERATE,
TEST SCORES HAVE FALLEN, WE'VE DROPPED TO 17TH IN EDUCATION...
SINCE THE ESTABLISHMENT OF THE DEPARTMENT OF EDUCATION and
CONTINUAL NEA 'STANDARDS'.
IT DOESN'T MEAN *YOU* CAN'T TRY READING!!!

939. wtb: Atari bits (UK)

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-27 00:00:00 UTC
From: Adrian Pickering <adrian@cherwell.com>
Message-ID: <34CE258E.53A3D5E2@cherwell.com>
Source record: 66648

I am starting to pine for my first computers (the TI99/4a was a family computer) and would like to get another Atari 8-bit.
Something exotic like a 1450XLD would be great, but a nice 800xl would keep me smiling. I really want to have Rescue on Fractalus and Elektraglide - two of the best games ever - preferabley *not* on tape.
I also remember having the trackerball and the Atari touch tablet!
Lovely.
Oh yes, an rs232 interface would be cool to.

If anyone in the UK can help me out, then thanks.

Adrian

A wee bit bitchy don't you think? I'll have a look through my old mags to try and find them but I don't expect to have much luck - you could try posting to the C64 group in the hope that the level skip codes are the same.

Gareth.

How does the Atari 850 interface work?

You HOOK IT UP to your Atari 8bit computer (Atari 400, 800, 800XL, 1200, 600XL, 65XE, 130 XE, XE Game System too, maybe) Then, in my opinion, you can hook up a STANDARD EXTERNAL MODEM. Also, it is possible to hook up a STANDARD PRINTER.

It may even be possible to hook up a SECOND STANDARD EXTERNAL MODEM to one of the other ports on the 850. This is my halfwitted idea, to run a double line BBS on my Atari 800, but I'm still puzzling out the details.

If all else fails, you might be able SELL YOUR ATARI 850 ON THE INTERNET. It is a great curiousity to computer nostalgia buffs, because it has MANY STRANGE PORTS AND OPENINGS and we don't really understand exactly WHAT THE HELL IS IT but it seems like it really MUST BE SOMETHING GREAT because it has MANY STRANGE PORTS AND OPENINGS.

Just a thought. When the 850 were new they came with a manual. Might be
just the thing
to explain the "MANY STRANGE PORTS AND OPENINGS".

950. sio2pc cable HELP

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-27 00:00:00 UTC
From: Linda Shippert <loo@u.washington.edu>
Message-ID: <Pine.OSF.3.96.980127193733.1788A-100000@becker2.u.washington.edu>
Source record: 66659

I've just spent the last 3 days trying to assemble an SIO2PC cable so that I can do all the fun things you're supposed to be able to do with one. I just can't seem to get it to work.

Specifically, I'm using the shareware version of ProSytem 1.15 that comes with APE 1.15 to try and make an .ATR image of a disk. I know the disk and the drive are okay (they work fine when hooked up to my 800xl) but when I hook the drive up to my PC with my cable, ProSystem says it can't sync the drive. When it tries, my drive does nothing, just sits there.

I'm using the instructions for an sio2PC from http://www.hackerz.com/atari/atari8.html and even found the actual radio shack parts by number provided.

Is there anything obvious that I might be doing wrong?

Is there a good place that I can get a cable ready made and tested? I'm pretty sick of spending so much time working on my own failure of a cable.

Thanks!

I guess I was fortunate never to have my BBS drives dying, but I had my
share of corrupted directories that needed formatting because of power
outtages or just plain bad luck.. ah.. the joys of being an 8bit sysop..
(or any CPU sysop for that matter!)

>Get that programm (for the emu !) and hmm....
>You can "unzip" the file with the emu then.
>Or get a (PC) programm, which can convert .DCM/.DC3 into .ATR or .
>XFD...

uh,no,they aren't zipped at all.Nor compressed in any other way except that
diskcomm doesn't bother to store empty sectors.
(and I'm told that duplicate sectors are stored only once)
Diskcomm isn't a file archiver at all.It stores whole disks
(or just the first # of sectors you specify)
sector-by-sector.Much like DMS files on the Amiga.
There might be files on the resulting diskcommed disk or a boot game or a data
disk or anything.It just creates a "image" of the disk.

Because of this DCM files should really be ALFed or at least ARCed to reduce
their size.Plus Gopher,Lynx and probably other programmes don't recognize the
DCM extention and won't allow you to download DCM files.
(but they usually recognize ARC)
If you do ALF a file you should probably still name it ".ARC" for that reason.
(Super UnARC and SpartaDOS X's ARC can handle ALF files)

Also,Diskcomm doesn't bother to write out blank sectors when un-diskcomming a
DCM file.So you should answer "yes" to the format question.You also must use a
drive that doesn't put garbage on the disk when formatting.
I know that 1050 drives with the "Duplicator" upgrade do this,as well as some
(all?) Trak drives.
Atari stock 810 and 1050 drives are good for un-diskcomming.I haven't tried the
XF551 drives yet but they have problems with original game disks anyway.
(the problem is with the copy-protection)

Well that's where the 1090XL would've come in handy,

>> Separate bank switching for Antic and the CPU? Big deal, no
>> one uses it. Atari tried to base everything on these IC's for a

Well with the Freddie chip you can store both CPU and ANTIC data in the banked memory.Otherwise any time you switch to another bank the picture would flicker. So you'd have to either store ANTIC or 6502 data but not both in bank-switched memory.

>> decade - I think a few enhancements to the 5200 would have been
>> appropriate, and by the time we got to the XE's we certainly
>>should have had an 80 column mode.
>There was a number of 80 col adapters starting with the 800 and
>thesehappened before the 64 came on the scene.

But then Atari got rid of the right cartridge port and the memory-upgrade cartridge ports.And the second two (PORTB) joystick ports.All used in some way to upgrade the Atari.And,acording to Bob Puff,the XEP-80 could barely keep up with 4800 baud.Data was transfered serially at 11000-12000 baud but it was 9-bit data.With start/stop bits that's 11 bits per byte,as oppossed to 10 for MODEMs.Plus the CPU had to synthesize the baud rate and at the same time answer SIO interupts from the 850,which also used the CPU to create the baud rate. (they're "bit-bangers",as my friend calls them)

>IBM didn't want the PC cloned. They used off the shelf components,
>but kept the information about its operating system (BIOS) a secret.
>It took the first company over 1 million dollars just to legally
>reverse
>engineer the bios.

Why would you need to reverse-engineer it.Just make your own BIOS.Didn't people
know how the hardware worked?
OF course any text-based programme should use the OS instead of the BIOS.
(try out ANSIPLUS off of the simtelnet directory at cdrom.com)
And graphical programmes just access the hardware directly since all that the
BIOS allows is single-pixel plotting.
(not even line-drawing and rectangular-fill like the Atari's S: device)
Basicly you're stuck with SETCOLOR,LOCATE,COLOR, and PLOT commands.
(for graphics,that is.Plus the TurboBASIC TEXT command)
Maybe if people had just creates a OS-compatible PC everyone would've forgot
about the BIOS and have created graphics (S:) and RS232 (R:) drivers.
(not to mention graphical printer drivers like Atari's G: device)

Those "little" computers have HUGE ammounts of RAM and speed.
Anyway,the CPU is different so of course no ammount of RAM nor speed increase would help.

>Oh you mean different memory banks right?

Actually it allows you to choose whether the ANTIC or 6502 (or both) see the
bank-switched memory or normal memory.IF you have it set for both then they
BOTH have to see the same bank.If you just have the ANTIC see the banked memory
then you can set up 8 video pages with 64k left for the CPU/6502.

>By the way the 800 had slots to allow for more memory

Isn't that how the Axlon worked?
(did you also need to run a wire to the motherboard)

>> >There was a number of 80 col adapters starting with the 800 and

>from >
>> having it as a built-in feature - like the C128.

Well if programmes would have a option to go through the CIO instead of the
hardware (thank GOD there's no BIOS) then any 80-column upgrade should work.
The same with picture viewing programmes.If GIFVIEW had a option to use the S:
device then you could view 1-bit GIFs on your XEP-80 attached monitor.

Hey!
I like E.T. and "Raiders of The Lost Ark"!
(never could beat the later)
Then again I like Adventure and "Sir Galahad and The Holy Grail".

Once again,unless they plan on making it for the 65816 with just 1MB
(or somesuch) it's not going to work.
(There are Ataris with 65816 CPUs and a megabyte of RAM)

I'd assume that anything from Microsoft would be made for Intel CPUs.
(80386 based,perhaps PEntium for new OSes)

With that programme to download via X-modem checksum a ATR file directly to
disk (stripping the 16-byte header file of course) that should work.
But remember that ATAPI CD drives will work on a Atari equiped with the ATAPI
("IDE") interface.But getting it from the CD to a disk is another matter.
Simple if you have a disk big enough to hold the ATR file,otherwise...

One nice thing about DCM files,besides their size,is that even if their too big
(if the whole disk was used for files,perhaps)
you can tell Diskcomm to break it up into smaller files.

Aren't there different formats of MOD tracker files?
For instance that IBM MOD files aren't limited to four channels.

>ObCSA8: Lately I ran across a program called SidPlay. For those who

I hope no Commies heard that!

The SID chip can produce more than just square waves.But it's limited to 3
channels.I don't know whether the SID chip's features could be emulated through
dynamic sound.
(i.e.constantly changing the POKEY sound registers,usually once a jiffy)

>> >2) Can the Atari 400 use "standard" Atari 2600 games cartridges?
>> nope.....sorry

The two systems really are totaly different except for the CPU.They might have similar capabilities but they are accessed in different manners.
Even if the video and audio hardware were exactly the same,the difference in speeds would break any game.(The HCS is faster than the VCS)
Even baring that,the cartridge ports have different PHYSICAL sizes!

Doesn't the Atari already support 320x242?
It supports horizontal half-clock resolutions of 256,320 and 384.
I thought that you could put as many lines on the screen as your TV supported,
with the exception that (at least with NTSC) that you can't use the first
8 scan-lines.Also many TVs are limited to 200 scan-lines anyway.I can just
barely use the default 192 on my TV.

You need to hook up your ATari <-> Disk Drive <-> APE interface in
that order, and then sector copy your disk from the real drive to a
disk image you create.

Using the ProSystem requires a seperate interface cable.

> I'm using the instructions for an sio2PC from
> http://www.hackerz.com/atari/atari8.html and even found the actual radio
> shack parts by number provided.

Try reading the documentation for the program at http://www.nacs.net/~classics
and see if that helps. If you need more help feel free to e-mail me.

> Is there a good place that I can get a cable ready made and tested? I'm
> pretty sick of spending so much time working on my own failure of a cable.

Your cable might work fine, you appear to just be using it with the wrong
program. If you still want to buy one, you can get it the same
please you can purchase APE. http://www.nacs.net/~classics

I have bunch of computing items for sale, everything used less than 1 ~ 6 months. Below are the items and Prices I'm selling. Let me know if you are interested.
I'm living in PDX. But shipping is no problem once I recieve the $$, or COD Cash is ok too.
send me an email if you need more info on any item.
reply to qdesign@ipns.com

Hardware

O Western Digital 6.4GB UDMA33 HDD - $245 (2 month old)

O 64MB SDRAM EEPROM 10ns w/ 8 chips - $150 (1 month old)

O HP 4C 600DPI optical res. Scanner New condition - $650

O WACOM ARTPAD 12"X12" w/ pen - $270

O 21" Viewsonic 1600X1200 max PT813 w/ SonicTron Tube - $1200 (still under 2 yr manufacture Warranty)

O USRobotics Sportster 33.6Kbps upg. to X2 56K w/ voice Full duplex - $60 (not a Winmodem)

O NEW Western Digital 9.1GB Ultra Wide SCSI HDD w/ Adaptec 2940UW SCSI Adapter Bundle - $999

O Matrox Mystique 220 retail box with Manual & CD Games with 8MB SGRAM to boost your 2D/3D games - $159

O SuperMicro P6DLE Dual Pentium II Motherboard w/ LX Chipset / AGP / 4DIMM / 3 ISA / 4 PCI / ACPI/PC 98 Features / ATX / USB - $275 ($539 with 233MHz PII CPU)

O Diamond FireGL 1000PRO w/ 8MB SGRAM w/ 8ns AGP - $179

O AOC 17" .26 Monitor 1280X1024 Max res. w/ JAG Digital Control w/ Dark Tint Screen for Acurate Colors. - $399

######### SOFTWARE #########

O Adobe Pagemaker 6.5 Full version with manual and CD in Box - $170

O Bryce 2 by MetaCreation - Create your world easily in 3D with built in modeler; save in major graphics format - $99

O Windows 95 OSR2.1 w/ USB w/ manual on CD Full version - $69

O MS Office 95 Standard Edition for Windows 95 oem - $69

O Macromedia Freehand Graphic Studio 7 w/ Freehand, Fontographer, more ... - $195

O Kai's Power Tools 3 for Win 95/NT - $85 (nice plug-ins for photoshop)

O Ray Dream Designer 4 by Fractal Design Corp. CD & Manual - $95

O Adobe Photoshop 4.01 Upgrade version 2 CDs - $120 w/ Manual

O The 11th Hour - sequel to the 7th guest - 4CDs - $30

O Kinetix 3D Studio MAX R2 Full Version 2CDs for Win 95/NT - $1795

All the parts & prices are effective from Jan. 28th 1998.
Please email me if you have any questions relating to any parts I have on sale.

Thanks
Kevin -

I can tell you that the Atari National Echo on FIDO still exists, but
messages are way down. You can kind of blame this ng for that :) But the
moderator has made it clear. Fido would kick the echo out if he allowed
cross-posting because this ng is not moderated.

I used to dream of crossposting in FoReM, PRO, Carina, Oasis, Fido, etc. I
guess it was only a dream.

970. Auction - Ends Thursday 1/29 - 8-Bit, Atari Connection #1

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-28 00:00:00 UTC
From: classicauc@aol.com
Message-ID: <19980128130600.IAA17989@ladder02.news.aol.com>
Source record: 66536

January Auction - Update 13

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Thursday, January 29, 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges/manuals/magazines; $6.95 if package includes systems, modules, hardware, or more than 2 books. I'll pay any difference. Some items require actual shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClassicAuc@aol.com.

Source record: 66538

I have two 850's. I used to be able to use them with a 2400 baud modem. I lost the cable that was attached to it when I bought it from the thrift store. Anyway, I built my own with the specs from the faq. I am using Bobterm and a 14.4 bocamodem. It dials, I connect. Then I shoot to the terminal screen and thats it! Nothing. Does this problem sound familiar to anyone? Something interesting:

I know the handler is supposed to load right away from the 850. For example, if I boot without a drive (just my 800xl), I do hear the handler from the 850. If I use DOS, I don't hear the handler. For some reason I remember hearing the beep even when I was using DOS when it was working right. Could this be my problem? I know that Bobterm is loading something because I hear the same beep after the title screen.

Oh yeah, I can only get bobterm to dial when I set it to 2400 baud or less. If I go higher, nothing.

Any ideas?

You need the proper AUTORUN.SYS to boot the handler software from the
interface. IIRC there's a special HANDLERS.SYS file atari supported since
DOS 2.5 (or DOS 3 to be precise since that was easier), it's loaded like a
usual AUTORUN.SYS file. For DOS 2.0S or earlier versions, there's no special
file to boot handlers. You need to join all these autoboot files together
and rename the resulting composed binary as AUTORUN.SYS. The handlers must
go in front, some adjustments might be necessary to start it in between.

As for the autoboot if no floppy is turned on: Hmm, I really wonder if this
is a hardware problem - that happens SOMETIMES with my 850XL, too, but
not always. I scanned the OS for the SIO calls that are needed to load the
handler, but found nothing relevant. Could be that the interface box mis-
interprets some of the SIO commands that are output early during startup and
needed to boot the floppy and/or to boot some mysterious parallel port
software (which was AFAIK never available either).

>Oh yeah, I can only get bobterm to dial when I set it to 2400 baud or less.
>If I go higher, nothing.

Hmm, modem settings? Just a stupid idea...

So long,
Thomas

From: Sean Gabb <old.whig@virgin.net>
Message-ID: <VorOXFAshuz0Ewxe@virgin.net>
Source record: 66540

I am trying to read my ancient Atari 8 bit data files on a pc. To this end, I have just dumped the contents of each disk using Anadisk, and have converted the results using Deana. However, I have no idea what to do next. Deana says that the files are now ready to be put through PC Kformer. I have a copy of this, but do not know how to use it.

Any help would be most gratefully received. I feel that I am on the edge of success in this matter, and have just one more effort before me.

>
>Adrian
>

Where abouts in the UK are you?
I moved down to Essex with work (bad move I know) from Wales,
and Cash Converters in Basildon regularly has Atari 8 bits stuff fairly
cheap.

I recently picked up an 800xl + XC12 tape drive and a heap of games for
ï¿½20 from the small ads section of the local newspaper. Your best bet is
imply to trawl through your local free papers. Next up is my childhood
dream of owning an ST and a 130 XE :)

What I am -really- desperate for though is a disk drive, 810 or 1050.

Oh, and a 400/800 for the nostalgia...

: That's odd.. I had 0 bad sectors on the MFM Seagates I formatted for my
: 8bit BBS 6 years ago...

6 years ago, I had a dozen or so MFM drives without bad sectors....your
point?

: > : If you are getting more than a few bad sectors, the HD will probably die
: > : when you use it (if it ever formats completely!)
: >
: > IBM's can deal with a few bad sectors....

: Yeah.. even the ATari can deal with a couple bad sectors

Not ones where they cannot reassign them. Did you read my message? Did you
understand it?

: I guess I was fortunate never to have my BBS drives dying, but I had my
: share of corrupted directories that needed formatting because of power
: outtages or just plain bad luck.. ah.. the joys of being an 8bit sysop..
: (or any CPU sysop for that matter!)

Drives are going to be tougher and tougher to find which will work
reliably on the Black Box. Without some mods to the BB, the newer drives
have parity permanently enabled, and more heads and cylinders than the BB
Rom has.......I think some upgrades are in order. Using a newer drive
would negate the need for Bad sector work arounds, of course.

Good luck. I hope you don't have to replace your drives anytime soon.

It's hard to believe that any of what you are saying is credible if you
are talking like you know this stuff when you don't.

IBM PC - 1977
IBM XT - 1981
IBM AT - 1983

The IBM PC, Apple II and CBM PET were all introduced in 1977.

I've posted about these a few times, and have even downloaded a few
different versions... it WOULD be nice to get fractalus running again on a
very speedy emulator!! (I got it to work a little, and it was SO much nicer
at a better speed then my old atari!! (and that was a WELCOME sight!!)
never could get the keys to work right though...
and have no idea about eidolon, or um that other fractal landscape space
tank game lucas did...
would really be nice to play em again!! (and I hate lugging my old atari's
outta the closet all the time!! ;)

I use an 850 with a 14.4 modem at 9600bps, the 850's upper speed limit.
For a while this 850 wouldn't respond to Bobterm commands at any speed over
4800, and reliably at 2400 and below. At first I thought the modem had
gone bad, but discounted that when I tried another modem. This continued
for many months until I got a different, much larger desk and completely
redesigned my hardware arrangement, which involved much disconnecting and
reconnecting of cables and case-shaking when things were moved around.
After that, it started working again, and I don't know why.

The only thing I can think of is the activity renewed a connection or two
that had gone bad. With that theory in mind, try opening your 850 case and
GENTLY rocking the chips in their sockets. I'd also look for a bad solder
joint while it was open. You might also try putting your 850 first in the
SIO daisy chain and try a different SIO cable between the computer and 850,
and check the RS232 cable for looseness and dirtyness.

Good luck! If you still have trouble, and suspect the modem configuration,
post here again and I'll post the configuration I'm using successfully.

WindowsCE is not necessarily tied to x86 processors. I believe the
popular CE machines run on Hitachi RISCS of some sort, like what's in the
Saturn.

: Wasn't it because of the changes that Warner brought about?

Had Atari looked to Jay Miner's team for the direction of the consumer division rather than constraining them (ultimately what was to become the Amiga), they would have stayed.

Nobody starts a company deciding to make a computer on their own unless it's a last resort.

: Doesn't the Atari already support 320x242?

Yes, but only 1-bit color depth. Maria supports much more than that, how much I don't know but it's more.

Maria on the Atari 8-bit would have been a hack because the Maria chip runs internally at 7.xx mhz. I doubt it would integrate well into an 8-bit archetecture, even though the 7800 uses the same 6502C at 1.79mhz as the 8-bit does.

Maria's sprite archetecture, so I'm told, has more in common with Williams' arcade hardware than the Atari 8-bit, but its display list ideas were definitely an extension of Antic.

987. more SIO2PC cable woes

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-28 00:00:00 UTC
From: Linda Shippert <loo@u.washington.edu>
Message-ID: <Pine.OSF.3.96.980128211513.19218A-100000@becker1.u.washington.edu>
Source record: 66553

Okay, I've figured out that the SIO2PC cable is supposed to be used with APE itself, not just with ProSystem, but it still doesn't seem to be working.

Is there any trick to APE other than configuring the com port, hooking up the cable to my 800XL and PC, loading a disk image, and turning on the 8bit? I HAVE tried reading the APE manual but all it does is make me think I'm dumb becasue they talk about everything being so easy.

I am using an old IBM PS/2 286 to run APE. Might the speed of the PC make a difference?

Is there any quick and easy way to test to make sure my cable is working? I don't know if the problem is my inability to understand APE or if my cable is no good (or both!)

Any/all help greatly appreciated!

The statement was there wasn't any 80 col mode. The fact is there were a
number of 80col hardware solutions As far as the XEP 80 goes it may not
have been the best solution
but simply a working one.

Warner definately exasperated situations at Atari at all levels. To
state thatengineers went from silicon design to case design is silly.
Engineers would move
before such a situation continued for very long.

There were LEGAL reasons to reverse-engineer the BIOS. The people at
Compaqunderstood that they wanted complete compatability with the IBM
software. Yes they
could have simply written a BIOS but that would have opened the
possibility of compatability
problems. At the time this wasn't acceptable.

Yes speciffically the IBM was out in 1981 the similar Heath-(Zenith)
system was before that,and the Compaq was out by 1983 He stated that the
Atari ST was out the same time
as the PC. Since I wasn't certain which, I went with the first clone
(and the last one of three,
which is by no means the same year as the ST (1985)) All of the
incarnations were at least two years
earlier.

I notice the Bluwave tagline... I used to use Bluewave for FIDONET and such from BBSs in the past. Is this newsgroup cross delivered to FIDO or some such other relay net? Since the internet has gained so much prominance most (all actually) local BBS have gone bye bye around here. I used to follow the Atari 8-bit FIDO base (and others) and sorely miss them. I was hoping there might be a way to get at them from the internet. Anyone have any clues?

1802 is strictly a composite/split-composite like the Commodore 1701,
1702, and CM-141. The composite/split-composite RGBs started with the
1902, 1902a, 2002 (by then Analog RGB added for Amiga support), 1084,
1084s, etc...

Source record: 66486

I have a question about an 800xl that I have (or had). I upgraded it already using a broken newer 800xl.
On the board, all of the ICs are socketed, not directly soldered in like some on the newer machine are. When you open it up, there is no sheetmetal plate covering the keyboard circuit board. The letters on the keyboard are smaller. It also had a CTIA chip instead of GTIA and a buggy BASIC rom.
So, I was just wondering what the deal is with this machine. I thought that all 800xl's had the GTIA, and CTIA was only in early 800s.

dear newsgroup,

i have a 1,2mb - 5 1/4 disk in my pc and I want to get my ataristuff on
it,stored on mostly dd-atari-formatted disks (on a 1050 with DOS 2.5).
anadisk seems to be able to read sd-disks, but deana simply crashes. and
crashes.
Now i canï¿½t get the third file mentioned in the faq, atario21, unpacked, the
2 files arc.exe & pkunpak are saying "no valid header".

can someone please help me by sending me atario21.exe or show me another way
to get my files from the disks into .atrï¿½s on my harddisk???
but my 1050, iï¿½m afraid, is dead.

thank you very much in advance

omar

Too obvious of a troll, really to busy to post, but...
This is not right, IBM published "The Technical Reference for the
Personal Computer XT". I have a copy. It has the COMPLETE
COMMENTED source code for the BIOS. 2nd poster is right, just to
add a few details on what I was told about the reverse
engineering that went on at AWARD, Phoenix, Compac, etcetera.
What they did: One group of programers read the bios source code
& wrote a specification that was handed to the 2nd group of
programmers. i.e. write a routine that initializes the disk drive

& passes the information to a routine that loads the boot sectors. This insured a work alike BIOS w/o contamination from the Copyrighted source code. As a matter of fact, a former Atarian, Charles Marslett of MyDOS fame, was one of the programmers for the Phoenix BIOS.

The 850 comes with an autoexec program which loads the drivers for the
serial ports and makes R1 - R4 available. Without the driver, which,
interestingly, is loaded by its own loader to make it relocatable (ie
with or without DOS) the 850 ain't a great deal of use.

Ha! You should talk. You don't know. The "IBM PC" was introduced in
1981. No other year. 1981. Remmeber it. In 1975, IBM introduced
it's model 5100. This was not the "PC". The PC was model 5150.
There were also models 5110 & 5120 before the PC. The XT came in
March of 1983. The IBM PC AT was introduced August 14, 1984. 1984.
1984. Please do not come down hard like that when you don't know. I
can quote my source if you like.

1010. looking for terminal emulation program

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-29 00:00:00 UTC
From: Daniel Woodard <woodardd@dma.org>
Message-ID: <6aotnrand5@sally.dma.org>
Source record: 66562

Hi! I found an Atari 130XE for $5 at the thrift store a couple of weeks ago. It has disk drive, modem, and this means that I now have everything necessary to do e-mail on it except for a VT100 terminal emulation program. I use a Unix system to do everything text based, and so I can use a C64 or whatever to check my e-mail. (or if I want to spend $2,000 on the latest IBM, that would work too) Anyway, I was wondering if someone has a disk that would meet my needs. In return, I know a place that has several Atari games on disk, and would trade 3 or 4 for the terminal program. I would actually prefer a cartridge, since this would mean that if my disk drive wore out, I could eventually just use my Atari 800 as an e-mail terminal, but I've been told that no cartridge for the 800XL did VT100 emulation. Anyway, if you can help me out, I'd really, really appreciate it.

Dan

P.S. - Was Geos ever released for the Atari 800XL?

Diskcomm uses RLE compression, as well as a compressing by storing only
parts of sectors that have changed since the last sector.

> Because of this DCM files should really be ALFed or at least ARCed to reduce

I only get about another 20% on a DCM w/ ZIP. Not bad for a scheme that
requires very little CPU time. Never tried it w/ ARC.

>Plus Gopher,Lynx and probably other programmes don't recognize the

That's bologna, an emulator cant tell if a disk is cracked or not
if it runs on a real atari it should run on an emulator

if it wont run on an emulator its not because of the copy protection
removal. NO emulator works with ape's .PRO format (only storage
format I know of that stores protections info) so theres no way to
tell. Most likely the game just doesnt run on the emulator, period.
Since you cant test the actual copy protected version on the emulator,
how would you know.

Mostly the keys dont seem to work right on those games, its probably
the original programmers using some kind of esoteric custom keyboard
routine rather than the one built into the o.s. and the timing is off

DKlugh,
I can't answer that specifically, but I can say that it BXL cart works on my 16K 400. So I suppose that actually would answer you question. I would guess that BXE would also with the exception that you wouldn't be able to load/use most or all of the extensions. In that case BXE would only be BXL. That being said, if you only have a machine with 48K or less, use BASIC XL. Getting the XE version would be a complete waste (unless you plan on picking up an XL or XE machine sometime in the future).
The extensions are what really make BXE the powerhouse that is. Both carts (BXL and BXE) work like normak 8K carts... so...

DKlugh,
How about this? Since Win is a layered OS (at least I assume it is), couldn't the hardware communication layer be rewritten to work with the 65816 system an enought RAM? The rest of the OS (upper layers don't care about the hardware. That's the nice thing about the newer OSes. You build a harware communication layer that the programs talk to tand that layer deals directly with the hardware. The user/programmers never have to deal with any hardware stuff. All the programs need to know is how to talk with the HC layer to accomplish the given task.
The only thing that bothers me about this is that the Atari 8-bit systems are perfect for dealing directly with the hardware. That's most of the fun!!! Sure, you'd be able to run you WinCE apps on your 8-bit, but you lose the pleasure of the "craft" and control of the system. My biggest thing about using PCs is that they are NOT easy to program in languages like BASIC. Since BASIC is basic and relates with hardware, it's a little hard to deal with Windows. The programming languages for Win are much more complex. Maybe someday I'll learn one of them (probably VB).

1018. Auction: Final Day! - Atari 8-Bit Assembler/Editor, Atari Connection #1, More!

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-29 00:00:00 UTC
From: classicauc@aol.com
Message-ID: <19980129125301.HAA15024@ladder03.news.aol.com>
Source record: 66570

January Auction - Update 14

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Thursday, January 29, 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges/manuals/magazines; $6.95 if package includes systems, modules, hardware, or more than 2 books. I'll pay any difference. Some items require actual shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClassicAuc@aol.com.

Sean,
I haven't use Deana (Ihave it though). Does it creat disk image files
with .XFD or .ATR extensions or straiget file conversions? If it makes
..ATR files fo the disks, that's great. Print out the READ.ME file that
came with the PC Xformer. These are the instructions for use. Basically,
CD to you XFormer directory. Be sure you have copies/moved the .ATR
files to that directory. Type xformer [-S -J -R -X] yourfile.ATR
nextfile.ATR ... then hot enter. (yourfile.ATR and nextfile.ATR should
be replaced with actual .ATR filenames.) The -L switches should be added
as needed to accedd sound joystick modem external Atari floppy when
present and to be used. That's that basics. Read the READ.ME file(s) for
more detailed info.

Ah, here we go... I can't say for sure, but, I have a 286 card that goes
into my Amiga and APE won't run with it (unfortunately, but, maybe it's
me!) however, the SIO2PC software works fine. So (obviously) my
suggestion is to try that instead.

What are you guys talking about? Modem Configurations? The modem I am using doesn't have any dip switches if thats what your talking about.

Bobterm settings? I think I use 9600 - full duplex - Ascii - thats about it isn't it?

Oh yeah, what order should the units be turned on in? Ive been doing modem,850, drives,computer.
And Bobterm does load an 850 handler doesn't it? I believe it will use one for the 850 as long as there isn't another one named RS232.COM and the disk (for example, one for the SX212, which, by the way, I have and it works wonderfully)

Thanks
Ascii

I don't think it is possible to use more than one of the serial ports
on the 850 at once in the way that is necessary for a multiline BBS.

Well, it was acceptable at the time, there were a plethora of
MS-DOS/CPM-86 machines in the mid-eighties that were not 100% IBM
compatible. Some weren't even close.

100% IBM compatibility was a huge competitive advantage for those that
achieved it, like Compaq.

Brent

If it would be text (!), it would be 1 MB probably, but I was
talking about scanning images. An image can vary from 1 KB to 1 GB,
depending on the selected resolution (dpi).

Well, just as an observation, not only have I been involved in just about
every major flamewar of the last four years, I have probably been the main
source of fuel and oxidant as well (if not the cause). Oh well.

Nope, "Can't we just be friends and live in a world without flamewars"
just wouldn't be very credible coming from moi.

As to "nostaliga computing"... who cares about nostaligia?

Since your the type of dirtball that prefers to steal rather than
work, why not just knock over a liquor store or steal your
grandmothers social security check for the money to buy it?

Seems simpler, and you might have some money left over for crack.

It needs to be text. Scan the pages & use OCR to get the text. Only have graphical images of any special non text / non OCRable items. Combine the extracted text back with the images of special items into a PDF or Word document. Granted this is more work than simple scanned pages but it makes a much more acceptable total document size. It is also less work than typing everything in by hand and still gives the bonus of having illustrations or what have you.

You have made an App that let people "STEEL" software, people use your software and make copies of programs I bought in the early 80's and then speed them over the net so people howw never bought the software can use it. Now I do not agree wwith giving someone a regester copy of any game, you are bitching about something that you have made possible for millions.

does not seem logicial

You're lucky, then. I dumped a few disks with Anadisk, following the
directions it gave regarding track #'s and everything, then used Deana on it,
and all Deana did was print a bunch of garbage to my screen. But I suspect
now that you've got a file that's ready, just give it an XFD extention, and
you can use it in any emulator that supports it. Or convert it to an ATR with
any of various utilities that do that.

> -Tom

That sounds really weird.

On sockets: Early (? might be linked to where they were produced)
800XLs were fully socketed. All (?) 600XLs were fully socketed.
Incidentally, I have not seen an 800XL that did not at least have
sockets for the big VLSI chips. Anyway, a fully socketed 800XL is not
unusual. I have owned a few.

The sheetmetal plate being missing is weird. Letters on the keyboard
varied by where the keyboard was made, I think.

The presence of a CTIA is *very* strange. Have you checked the
revision of the BASIC ROM to see if it is rev A or rev B? By a "buggy
BASIC rom" do you mean the rev A bugset? (Stock XLs came with rev B
which iirc fixed some but not all of the rev A bugs but introduced new
ones too).

My first guess, based on the sheet metal plate being missing and the
CTIA, would be it has been repaired, and the shop or owner replaced a
bad GTIA with a spare CTIA they had hanging around. I would consider
this more likely than a factory 800XL coming with a CTIA, or that your
machine might be some sort of weird cobbled-together prototype.

I have quite a lot of Atari 8 bit kit which I have decided I could sell
now.

I will sort out a full list over the weekend.

It does include

Atari 400 with 48 K memory and improved keyboard
Atari 810 Drive
Atari 850 RS232 port
Atari 130 (?) - anyway the 128K job

Plus cartdridges and many books and manuals.

PLUS

ATR-8000 (64K CPM computer) with 8088 + 256K memory
TWIN 5.25" DISK DRIVE
TWIN 8" DISK DRIVE
(these are sufficient density to give 1 Mbyte / drive)

and cables and connectors so that all four drives can be on at the same
time.

Plus manuals and CP/M and msdos software

I think everything works except I was having some trouble with the
printer port (edge connector) on the ATR-8000.

Brent,
That is correct. This is also the case with the ICD MI/O. However, I don't know if the BlackBox can do more than one R: port at a time. The interesting part is that you can select different Rn: ports (R1:, R2:, R3: or R4:) and run the peripheral that is on that particular port. You'd think that since the MI/O is connect to the PBI or ECI port that it could deal with multiple serial port signals. I guess it wasn't that suffisticated. The BB may be though. Bob Puff has some amazing stuff in that beast.

Yeah, I hate that too. Trying to figure out which order the components should be turned on in. Uhhh, 850, then diskdrive then computer? Uhhh, computer then 850 then diskdrive?

It matters too because sometimes the software fails to run unless you hit those switches in order.

The 850 is a stupid weird item in another way, because you have to run the cables right into the face of it. No way to make it look neat on the desktop hardly.

Anyone ever actually use all the ports at once?

vs

Oh boy, here we go again......

APE is a great tool that can be abused just like any photocopy machine, CD recorder, or VCR. You can make legal copies of your software and put them on a PC hard disk, or you can use APE to run stolen software. The choice is yours, so don't blame Steve for making the tool.

The black box has a single built-in serial port. You may be able to
run it at the same time as an 850 or P:R: connection for a total of
two active serial ports, I don't know.

Am posting this second time before telling people what they can have
sometime next week or so.

If you see anything you want, need, etc MAKE an offer. (I prefer not to
set prices.)

If anyone wants to make an offer on the lot, go ahead....
people won't laugh at you (much!).

Buyers will be responsible for all shipping/handling charges.
Sales to contiguous US only.

Atari Games for Sale

(All complete with boxes and documentation, unless otherwise noted)

Cartridges

**Atari

c Centipede Zap the worm and all his parts. Arcade
game.

c E.T. Phone Home Help E.T. find the parts to make
his phone.

c Missile Command Save your cities from alien attack.

c Star Raiders Some more stupid spaceships!

**Imagic

c Atlantis Missile Command under water.

c Demon Attack Space Invaders with flapping wings.

**Spinnaker (once again, nice but heavy premium plastic packaging)

c Fraction Fever Shouldn't 98.6 be 98 3/5 ?

c Story Machine Kind of a "mad lib" for your kids.

**Thorn EMI (Once again, neat little BETA boxes)

c Kickback A soccer-like breakthru game.
Did I mention soccer is like unto
great gasping intakes of air!

c Jumbo Jet Pilot Take your seat at the controls of
a jumbo jet. Fly it upside down...

see passengers grab for Gravol...
mess up the President's $200 haircut..
console Bobby because they shot his
dog before boarding.... JUST KIDDING!

DID YOU REALIZE THERE IS A RUMOUR CASSETTE TAPES MAKE EXCELLENT KINDLING!

Cassette Tapes
~~~~~~~~ ~~~~~
**AIM Software

t X-Ray Art construction game

**Atari Corp

t States and Capitals Program cassette ONLY, Instructions and
game on tape.

**Cosmi

t Aztec Challenge Seems to be "Mountain King" type game.

t Caverns of Khafka typical cavern-tomb danger graphics
game

t The Crypts of Plumbous A lot like "Defender", as I recall.

t Forbidden Forest Find your way out of a deadly graphic
forest

t Galactic Avenger "Space Invaders" type game

t Professor IQ Series of educational learning games

t Slinky You've played with the springs, now try
them on the screen!!

t Spider Invasion Destroy deadly spider mutations, their
eggs and nest. Are you getting as
itchy as I am?

**Edu-ware Services

t Compu-read 3.0 Tool for improving reading speed and
comprehension. NOT boxed, but in it's
own folder including docs.

**EPYX

t Curse of Ra Expansion module for "Temple of Apshai"
adventure game. Book of Lore missing.

**Program Design, Inc.

t Addition with Carrying Math games for the young. In clear
plastic sleeve.
~~~~~~~~

t Sam the Sea Serpent Sammy will devour your child if he
gives the wrong answer! (Just Kidding
!!). A story and game for your young
ones.

**Thorn EMI -- love their packaging....beta-like plastic containers
(and we all know where beta is)

t Compute 4 & Reversi Connect-4 game and "Go" type game

t Cribbage & Dominoes Cribbage & Dominoes...get the idea?

t Darts So safe, you can even throw them at
your Mother-in-Law

t European Scene Jigsaw Like those plastic toys where you
Puzzles Vol2 slide the tiles to get the picture
together.

t Figure Fun Two games to teach multiplication,
division, etc. Five levels, cover most
ages

t Owari & Bull and Cow Computer renditions of traditional folk
games

t Pool Everybody in the Pool !! No, not that
kind -- tournament and eight-ball,
practice included.

t Snooker & Billiards Pool with fewer balls and no numbers.

t Super Cubes and Slip Rubik's Cube and marble maze in
computer form.

DON'T TELL *ME* YOU HAVEN'T HEARD 5-1/4" FLOPPIES MAKE GREAT VALENTINE
GIFTS!!!!

5-1/4" diskettes
~~~~~~ ~~~~~~~~~
**Activision

d Master of the Lamps Riddles of music memory and color,
album type packaging

**ALA

d Dragon's Hideaway Gather the Dragon's eggs...make a
medieval omelet??

**Atari

d Caverns of Mars Primitive Zaxxon in a Martian cave

**Atari Program Exchange
~~~~~~

d Galahad and the Holy Grail Fairly well known adventure game, in
ziplock packaging.

d Seven Card Stud Monty Webb's poker game. Ziplock
packaging.

**Avalon Hill

d Divex Another darned "teach your kid" number
stuff... don't YOU ever sit down with
him??

**CBS Software

d Success With Math: Math for grade levels 5-8
Fractions

d Success with Math: Grade levels 7-11
Linear Equations

d Success with Math: Grade levels 9-12
Quadratic Equations

**Cosmi

d The E Factor Save your planet against mimes, aliens
and asteroids!! Sorry, Marcel, oops,
that's "Mines"

**Crystalware

d Imperial Walker Idiotic robot elephant from Star Wars

**DataMost

d Ardy the Anteater Anteater slurping up those ants !

d Night Raiders Blow up the alien spaceships
again...don't they ever give up?

d The Tail of Beta Lyrae Lyrae is blow up the spaceships you
& Round About missed before, Round About .. blow up
strange shapes. Two games in one
ziplock. ~~~

**EPYX

d King Arthur's Heir Camelot adventure game. Has nothing to
do with Royal toupees.

d Temple of Apshai Base for other DUNJONQUEST games.
Includes both cassette version and
5 1/4" disk.

d Upper Reaches of Apshai Another expansion module for Temple of
Apshai. Book of Lore missing.

**Hayden Software

d Final Conflict Futuristic tank warfare game

**K-TEK

d Gorgon Rescue the Golden Fleece with Jason,
beware Medusa, beware this game... it's
Booorrrrriiiinnnggggg.

**KeyPunch Software

d Strategy Simulations Robot Patrol, Star Merchant, Civil War,
Convoy. Sure sounds like public domain
games to me ! In plastic sleeve.

**Learning Company

d Word Spinner Basic building blocks of reading, ages
6 - 10. In cardboard folder.

**Main Street Publishing

d Ardy the Aardvark Same game as above, repackaged in
ziplock.

**Penguin Software

d The Quest Fairly decent graphic adventure game

**Scholastic

d Agent USA Educational puzzle solving adventure
for ages 9 to adult. Nice, but heavy
packaging.

d Turtle Tracks LOGO-type graphics language program
for ages 9 to adults. Also nicely but
heavily packaged.

**Sirius

d Blade of Blackpool Illustrated myth and magic graphics
adventure game. Not bad.

d Fast Eddie Jumpman, Donkey Kong type arcade game.

d Wayout Colorful elaborate maze game. Still
has the CLOWN glasses !!

**Spinnaker (Heavy plastic box packaging...nice, but probably
expensive to mail !)

d Kinder Comp Collection of six educational games.
Boy, are your kids going to be smart !!

d Snooper Troops, Case #1 Kids detective game. Teaches problem
solving, deductive skills

d Snooper Troops, Case #2 Are your kids skilled yet? If not, try
this one too.

**Thorn EMI

d Home Financial Management If you buy all the above, this will
help tell you how much over budget you
are!!

**Walt Disney PC Software

d Mickey & the Great Outdoors If your kid can only learn from a
mouse, this is the one to do it.
More math and literacy skills.
By the way,
BOYCOTT DISNEY/ABC !!!

1049. K-Products hard drive

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-30 00:00:00 UTC
From: Jerry Glenwright <j.glenwright@ndirect.co.uk>
Message-ID: <01bd2db2$97e46c00$LocalHost@fivvwrpw>
Source record: 66508

Hello all

Anyone have any experience connecting a Syquest removable media drive to a K-Products hard drive interface? It's currently running a 20Mb hard drive at the moment but I've been given a Syquest that I'd dearly like to put to good use with my 8-bits!

Best wishes

Jerry

1050. Power supply question

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-30 00:00:00 UTC
From: Jerry Glenwright <j.glenwright@ndirect.co.uk>
Message-ID: <01bd2db3$d5310f40$LocalHost@fivvwrpw>
Source record: 66509

Hey all

Dunno about the rest of the world, but here in the UK there are at least two types of 9v AC power supply: the kind of upright thing with the cut-off corners and the hollow rivets at the base, and the flatish lozenge-shaped one. This latter is good for 3.5amps according to the legend on the case.

Question is, are they completely interchangeable? I mean, I know that they both actually work with 1050s, 810s, the 800, 400 and the 1200XL cos I've tried them, but which power supply was originally specified for which equipment? After all, that's a pretty hefty current potential and it was obviously meant to drive something!

Back in 1985, my original 800xl came with the 5v DC supply and my 1050 had an upright/cut-corner 9v supply.

On a similar theme, does anyone know of a good schematic for home-brewing the AC adaptors? They're thin on the ground here and expensive. It is possible to adapt (!) 9v/1.5amp DC adaptors? I'm not a total klutz with a soldering iron but I'm no electronic whizz either! Is it imply a matter of taking out the bit of the circuit (Zener diode bridge, I'm presuming) which rectifies the AC current?

Best wishes

Jerry

There are a TON of parameters set in these high speed modems. No
switches, it's all in RAM inside the modem. Once set, these values do
not go away when you power off or use the modem.... So, if they are
goofed up, you have to reset/set them. High speed modems talk to the
computer at 2400 baud AND the set interface speed, up to 115,200 baud.
They talk over the telephone line at the speed that they calculate the
other modem and line will tolerate, 14,400 and up. Now, you ask yerself
- how can they talk to the computer at 115,200 and talk to the other
modem at 33,600? Easy.... the modem itself compresses the data in
strange and wonderous ways! This is a major reason that you get results
like: it dials and answers and then nothing. Or: I can't talk to the
modem at 9600 baud like I should be able to.
You really need the book for the modem to send it the proper commands
for setup .... but, usually, AT&F will reset the modem to the factory
default. Unfortunately, this is not always what you need, but it is a
starting point. I had good results with a Hayes 14,400 modem on my 850 -
then I got a Supra 33,600. Bummer. It works, but is a bear to deal with.

Never heard of an 800XL with a CTIA - very few 800s had them, really.
All the 800XLs had shields also. Somebody been under your covers....

Bob

the early 800XLs did have a different keyboard and all socketed chips. I
have a couple like that.

How can a Black Box have a faster RS232 port than any other interface?
If you feed the data
too fast to the computer you over run the buffer and trash the data.
The MIO has the same speed, along with the RS232 handler. How can one
say one is any faster than the other when the limit is 19.2 without over
running the buffer and you are pushing it at that?? Each interface
can achive that baud rate with the exception of the PRC: connection wich
is limited!

What order do you turn things on? I'm afraid I'm going to disappoint there. All my equipment is plugged into one surge suppressor/power tap. That includes computer, monitor, two drives, modem, printer, 850, and a tape drive I never use anymore. The power switches for everything but the computer and printer are on all the time, and I power everything up and down with the power tap master switch. Normally, I hit the master switch, then the computer. The printer stays off unless I'm using it. I've never had a problem with doing this, and I've been doing it daily for at least 7 years.

An R: handler resides in ROM inside the 850. (same thing for p:r: Connection) When Bobterm boots, it checks D: for the presence of a file named RS232.COM. If it doesn't find it, it attempts to load the R: handler from the 850 ROM. If it doesn't find that, the boot fails. Other programs, like Ice-T, may operate differently.

What are we talking about when we say "modem configuration"? Every modern Hayes-compatible modem has AT commands and S-Registers inside it that set the modem's various functions. These commands have factory settings that are used each time the modem is powered up, unless a different configuration, or "profile" is activated to be used at powerup. To see what your configurations are, boot Bobterm, then go to the terminal screen without going online. Make sure Bobterm's baud rate setting is on your modem is capable of using. Type in AT&V then RETURN and all the settings that are stored as profiles will be displayed. Consult your modem manual for the meanings of thevarious commands and settings in the display, and for the AT commands needed to change them, if necessary.

-=- Alternative Party Advertisement -=-
(excerpt from the invitation)

The Alternative Party is a party for machines normal parties always ignore.
Have you ever seen anyone using a VAX or a PDP at Assembly, The Party or any
other place on this side of the galaxy? Me neither. The Alternative Party
will be the start of a new era where people do not have to be ashamed about
using a computer nobody else recognizes. It's our turn to fight back for a
new, brighter future!

To put it simply: you can compete in the compos with any machine except
any PC over a 286 or an AGA Amiga (old Amigas are fine). F.ex. Altair,
Amiga500, Atari, Commodore 64, Cray, Eniac, PalmPilot, TI-85 etc. etc.

I have the following system for sale. Will consider offers on all items.
Unless noted below, all items are in good working condition. Cables and power
supplies are included where appropriate. No manuals or original packaging.
Buyer pays shipping.

Atari 800 computer
Atari 1050 disk drive
Okimate 10 printer w/spare color & BW ribbons - 3 rolls of thermal paper
2 - Epyx 500XJ joysticks (have been repaired to fix broken mounting tab inside)

$40.00 plus shipping. This will weigh a lot, expect $10 to $20 for shipping
via UPS ground.

Miscellaneous items:

Atari 1020 color plotter w/paper and ribbons - $5.00
MicroPrint printer interface - $5.00
Wico track ball - $2.00
Atari paddle controllers - $2.00

Wierd stuff FREE for shipping costs:

* Atari 400/800 - 16K RAM module (one bad chip)
* Atari 800 motherboard with bad PIA chip
* Radio Shack joysticks (one converted to control cursor on Atari)
* Radio Shack DMP110 dot matrix printer (missing cover) w/spare ribbon
* HAL IBM PCXT compatiable computer (made in Champaign, IL - home of the HAL
computer of movie fame) w/keyboard & VGA graphics card
* Supra HD drive case & power supply (Last used to externally mount tape drive
to IBM PC)
* 25 pin A/B switch w/o case

Please reply to gwestndrf@aol.com.

Thanks,
Gail

Not sure what modem he was using but the Hayes and Supra's use the
Rockwell chipsets. Rockwell publishes complete and technically
detailed instruction set documentation for it's chipsets. You have to
go to the Japan Rockwell site to get at these I believe. Check it
out.

I have a lot of that stuff I got quite some time back.

Bob, it was my understanding that like you say the PR:C (which I have
one) is itslef limited to less than 19.2Kbps (9600bps I think) and
that the 850 is also limited itself to 9600bps. The MIO I was unsure
of but did underand that it does not provide hardware flow control,
which basically makes it usless over 9600bps anyway. Please feel free
to update/correct/spank me.

Hello!

I have a complete Atari 800 system, 810 Disk Drive, Cassette Recorder, etc.
A whole box of cartridges and games. 2 boxes of stuff ready to go.

Everything works.

I prefer not to throw this in a landfill, and I saw these newsgroups.

I live in the greater Boston area, so if you're local come and get it!!

If not, I have no problem shipping this stuff for the COD fee ONLY. I'm
guessing probably around $30 per box for shipping, etc.

Please let me know soon...

Hello!

I have a complete Atari 800 system, 810 Disk Drive, Cassette Recorder, etc.
A whole box of cartridges and games. 2 boxes of stuff ready to go.

Everything works.

I prefer not to throw this in a landfill, and I saw these newsgroups.

I live in the greater Boston area, so if you're local come and get it!!

If not, I have no problem shipping this stuff for the COD fee ONLY. I'm
guessing probably around $30 per box for shipping, etc.

Please let me know soon...

Not only that, but that listing does not show ALL settings. It shows
many but not all. Trust me.

> !! Request my *FOR SALE* LISTING OF CLASSIC VIDEO GAME STUFF !! 2000+ Lines !!

Steve, Im not saying that people should not buy your software but......

This is taken from the GNU site:

``For free''

If you want to say that a program is free software, please don't say that it is available ``for free.'' That
term specifically means ``for zero price.'' Free software is a matter of freedom, not price.

Free software is often available for free--for example, on many FTP servers. But free software copies are also
available for a price on CD-ROMs, and proprietary software copies may occasionally be available for free.

``Give away software''

It's misleading to use the term ``give away'' to mean ``distribute a program as free software.'' It has the
same problem as ``for free'': it implies the issue is price, not freedom.

``Piracy''

Publishers often refer to prohibited copying as ``piracy.'' In this way, they imply that illegal copying is
ethically equivalent to attacking ships on the high seas, kidnaping and murdering the people on them.

If you don't believe that illegal copying is just like kidnaping and murder, you might prefer not to use the
word ``piracy'' to describe it. Neutral terms such as ``prohibited copying'' or ``illegal copying'' are
available for use instead. Some of us might even prefer to use a positive term such as ``sharing information
with your neighbor.''

``Protection''

Publishers' lawyers love to use the term ``protection'' to describe copyright. This word carries the
implication of preventing destruction or suffering; therefore, it encourages people to identify with the owner
and publisher who benefit from copyright, rather than with the users who are restricted by it.

It is easy to avoid ``protection'' and use neutral terms instead. For example, instead of ``Copyright
protection lasts a very long time,'' you can say, ``Copyright lasts a very long time.''

``Sell software''

The term ``sell software'' is ambiguous. Strictly speaking, exchanging a copy of a free program for a sum of
money is ``selling''; but people usually associate the term ``sell'' with proprietary restrictions on the
subsequent use of the software. You can be more precise, and prevent confusion, by saying either ``distributing
copies of a program for a fee'' or ``imposing proprietary restrictions on the use of a program,'' depending on
what you mean.

``Theft''

Copyright apologists often to use words like ``stolen'' and ``theft'' to describe copyright infringement. At
the same time, they ask us to treat the legal system as an authority on ethics: if copying is forbidden, it
must be wrong.

So it is pertinent to mention that the legal system--at least in the US--rejects the idea that copyright
infringement is ``theft''. Copyright advocates who use terms like ``stolen'' are misrepresenting the authority
that they appeal to.

The idea that laws decide what is right or wrong is mistaken in general. Laws are, at their best, an attempt to

achieve justice; to say that laws define justice or ethical conduct is turning things upside down.

Copyright (C) 1996, 1997 Free Software Foundation, Inc., 59 Temple Place - Suite 330, Boston, MA 02111, USA

Verbatim copying and distribution is permitted in any medium, provided this notice is preserved.

You really don't need to call people dirtballs. I've seen really mean posts from you in the past,
and for that reason I will never send you any money. I've stopped using your program so please save yourself
some time by not talking crap about me. You might want to rethink your business practices. Get over yourself.

Source record: 66444

You have to reprogram the rom, and open up drives 4, 5, 6, 7, 8. There are instructions on
the disk that came with the interface, or at least there should have been documentation on the
disk. You at this time are only going to be able to use 6 16mg partitions due to dos limitation and the Rom set up. Your scsi hard drive has to be able to read 256 bytes per sector not the
IBM format of 512 bytes per sector.

As to the message you replied, if he is talking about the KPI the Seagate removable depending
upon the modle should be able to be formatted with the Sasifmt.com file using the 2 head option.

Here's the README for uploads to the atari archive at umich:
<ftp://atari.archive.umich.edu//atari/0README_ALL_UPLOADERS>

Uploaders: Please put files in /New. They will be checked and moved to
their proper place within a few days. They will also appear in /Newitems
when this occurs.

When uploading anything, please upload a text file or files that describe the
other file(s) uploaded. Also, please stick your email address in these
description files. We tend to frown upon self extracting archives, as they
cannot be verified on the UNIX boxes, and because they waste space on the
archive. However, if the author of a program chooses to distribute their
work in that format, it is OK (one example is the recent versions of lharc,
which are quite naturally self extracting archives).

The BEST way to upload (and to ensure that the files are moved as quickly
as possible) is to have a small description file for each archive uploaded.
For example:

blah1.zip
blah1.readme

neoptc40.lzh
neoptc40.txt
^
|
\ which might say "Neodesk patch 4.0, uploaded by boyd@math.fsu.edu"

Thanks for your cooperation.

Mickey Boyd

It would also be extremely helpful if the uploader could suggest a final
resting place in the archive, thereby taking some of the guess work out
of trying to maintain this site.

"I suggest this file foo.zip be placed in /Utilities"

or

"This file foo4.zip should replace foo3.zip in /Archivers"

Please also make sure that you send the files to _THIS_ site, and not
to the mirror sites. It's a problem for the sysadmin at the mirror
sites to handle files manually, and it's unnecessary since the mirrors
do this automatically.

ftp://atari.archive.umich.edu/New

Thanx!

I meant to say that the settings listed with that command are the ones where changes can be stored to be applied next time the modem is powered up. There are indeed more settings, but if you change them you must do it every session.

Jm> have graphical images of any special non text / non OCRable items.
Jm> Combine the extracted text back with the images of special items into
Jm> a PDF or Word document. Granted this is more work than simple scanned
Jm> pages but it makes a much more acceptable total document size. It is
Jm> also less work than typing everything in by hand and still gives the
Jm> bonus of having illustrations or what have you.

That's the problem. You need GOOD OCR software, you need to split the
Images, and that in a very short time.
After producing the CDrom, we'll if we get to HTML/ing the stuff
(that's what the author really wanted in fact...).

ABBUC is a German usergroup, and AFAIK they don't have an US distributor.
Maybe B&C Computervisions in California or Nick Kennedy (author of SIO2PC),
or Steven Tucker (The APE guy)?
If not, you'll probably have to wait for a while...

Correct. The BB has but one serial port. It is however, a faster
serial port than available on any other Atari8 interface. It also
supports hardware flow control.

I don't mind if it's on tape, disk or cart, a copy, original or
needs typing in from the back of an old copy of Big K.
Thanks. sean@thegate.demon.co.uk

1091. Re: junk on our newsgroup

Newsgroup: comp.sys.atari.8bit
Date: 1998-01-31 00:00:00 UTC
From: aaron@orr.wfi-inc.com
Message-ID: <6avpm0apc1@news01.deltanet.com>
Source record: 66529

Without question, this is one of the most spam-free newsgroups I've ever read. Maybe spammers feel that any whacko that still uses an 8-bit Atari must either be too crazy or too dumb to be an effective marketing target. If you look at it that way, it's a little insulting - we don't like hot women, care about our weight, want to make big $$$ quick, use gas/phone/etc cards, or any of the other BS I get mail for every day.

BTW, is there an 8-bit mailing list anywhere? I haven't seen one yet....if not, would anyone be interested in being a part of one if I started one?

Aaron

necromancer is on Yogi's jellystone site.. It's a MegaImage.. I forget
the number.. #08 I think..

It plays VERY well on Xlit.. one of the better Atari 8bit games.

probably the best way to take those spam demons out of business is for all
of us to send them 100 or so junk e-mail. See how they like their e-mail
boxes being filled up with meaningless drivel!

heheh

Subject: 3.1) What is INFO-ATARI8?

INFO-ATARI8 is an e-mail list for discussion about the Atari 8-bit family of
computers.

To subscribe to INFO-ATARI8, send a message to:
mailto:listserv@vm.marist.edu
that says:
subscribe info-atari8

Owner= HARRY@MARIST (A Harry Williams)

comp.sys.atari.8bit postings no longer appear in INFO-ATARI8.

INFO-ATARI8 was created on December 9, 1986.

Subject: 3.2) What is the Classic Computers List?

The Classic Computers List is a discussion list for people who
collect/preserve/restore old computers of any kind. If you would like more
info you can find it at http://haliotis.bothell.washington.edu

If you don't have access to the web, then send an e-mail to
mailto:bill@booster.u.washington.edu (Bill Whitson, ClassicCmp ListOp).

On the web site you'll find information on how to subscribe in addition to the
two ClassicCmp FAQs. If you decide to subscribe, please read all three
documents first.

Subject: 3.3) What is ATARIPL?

From: Wojciech Hartman <harti@waw.pdi.net>
Date: Saturday, March 15, 1997 3:51 AM

I am proud to announce that there is a mailing list "ataripl" for all
polish-speaking Atari users and enthusiasts.

To subscribe the lists you have to send an email to
mailto:majordomo@piwo.bl.pg.gda.pl containing a line "subscribe ataripl".

Subject: 3.4) What is ATARI8-L?

atari8-l mailing list

created especially for discussion about ANIX project (unix for atari8),
but any atari 8bit related threads are welcome. english language only.

to subscribe, please mail a message to
mailto:majordomo@zwieracz.pse.pl

containing a line:

subscribe atari8-l <mailing address you'd like to receive the list to>

in the body (not the subject) of your message

there is also mail2news gateway that translates all postings on the
list to easy to read usenet articles, available read-only to everyone at:
news://zwieracz.pse.pl/listserv.atari8-l

if you get any problems, please report to
maciej grzeszczuk, mailto:krap@zwieracz.pse.pl

Subject: 3.5) What is ATARI8PL-L?

any atari 8bit related threads are welcome. Polish language only.

to subscribe, please mail a message to
mailto:majordomo@zwieracz.pse.pl

containing a line:

subscribe atari8pl-l <mailing address you'd like to receive the list to>

in the body (not the subject) of your message

if you get any problems, please report to
maciej grzeszczuk, mailto:krap@zwieracz.pse.pl

From: GAREEE! <gareee@worldnet.att.net>
Message-ID: <6b32v4$3t@bgtnsc02.worldnet.att.net>
Source record: 66385

Gee after reading all the replys to this thread, I know where the 8-bit maret went.. I'm kinda sorry I replied to the original post now... The only thing I wanted, was a simple painless way to get a few of my old favorite games onto my pc to work with the emulator.. and suddenly there's a whole heap o crap lying in here..
and before ya ask, Yeah I have my atari still all 3 of em, and yes, I bought all the lucasfilm stuff.. I just really don't wanna lug the whole pile out, set them up, order this transfer thing, find the disks, and copy them into files for the pc, when I KNOW there surely must be someone who's already done this...

If I had a few extra weeks of my time, I might, but playing a few 15 yr old games just ain't worth that kinda time investment...

I won't ask if anyone has them again.. I'll just drag my machines out a few years down the road, and look at them then....

================VINTAGE MICRO-COMPUTERS===============
=========="Your Friendly Online Computer Store"=========
============EMAIL: Vintage_Micro@yahoo.com=============
******************************************************
Hi Computer Lovers,
>>> Well looks like the new year has definately taken a foothold on us all by now. Things
are definately getting interesting in the computer world, if you don't know what I am
talking about then pop onto ZDNET when you get a chance.
>>> There are also alot of breakthroughs going on in the Vintage Commodore Community. We
have 2 new Major Geos Upgrades around the corner, and the new SuperCPU 128 that will bring
the 2 mhz Commodore 128 Computer to a full 20 mhz. Very cool!
>>> Anything on this list I will accept trades for Amiga items. The proceeds enable me to
further my beloved hobby and also help others who collect/use/love old micro-computers. Of
course my main love and area of expertise is the C64. I am in the process of moving into
the world of the Amiga.
>>> Check out the new Sega Genesis cartridge section. A few new books and magazines have
been added. And I have a few x1541 Cables ready to mail too!
>>> You will notice that I am trying to be as detailed as possible about my listings. I am
a collector and have been buying items online for a while and I really wish everyone would
list in a detailed manner. It definately makes it easier on the customer, so that they can
decide if said item is useful to them or not. I will also try to answer as many questions
as I can about each item listed.
>>> This list keeps expanding(so check it regularly or request to receive updates via
email). Email me your orders and I will process them as fast as I can. To make the
transaction faster, please email your address with your order, that way I can calculate
shipping and give you a total.
>>> Also... if you wish to receive future lists by email, send me email with the word
"subscribe" in the subject line.
>>> Thanks Everyone!

lighten up the guilt with a Commodore theme. A Selection of Wallpapers
and Icons for you Windows 95 desktop with a Commodore Theme on a 3.5
inch disk. Advance orders will be accepted now. Will be available by 2nd
week of Feb.
PRICE: $7
```

TITLE: Guilt Free Wall Papers and Icons! Atari 8 bit Edition
COMING SOON!!!

==ATARI====ATARI====ATARI====ATARI====ATARI===ATARI==
======ATARI====ATARI====ATARI====ATARI====ATARI======

//////////ATARI 8 BIT SOFTWARE\\\\\\\\\\

TITLE: Educational System Master Cartridge (cxl4001)
PUBLISHER: Atari
REQUIREMENTS: Atari 400/800,XL's, XE's and an open cartridge slot.
NOTES: This is the second cartidge of this type that I have came across.
Apparently this cart. is slightly rare to find. I do not know anything
about it, except that it does come up fine on my XE. If anyone knows
anything about this cart. then please let me know.
PRICE: $4

TITLE: Atari Basic Cartridge (cxl4002)
PUBLISHER: Atari
REQUIREMENTS: Atari 400/800,XL's, XE's and an open cartridge slot.
NOTES: You need this to use Basic on most Atari 8 Bit Computers.
PRICE: $4

TITLE: Pac-Man (cxl4022)
PUBLISHER: Atari
REQUIREMENTS: Atari 400/800,XL's, XE's and an open cartridge slot.
NOTES: The arcade game of 1 hungry little spot with an aversion to
ghosts!
PRICE: $5.25

TITLE: Star Raiders (cxl4011)
PUBLISHER: Atari
REQUIREMENTS: Atari 400/800,XL's, XE's and an open cartridge slot.
NOTES: Space type arcade game
PRICE: $4

TITLE: Ultima IV - Quest of the Avatar
PUBLISHER: Origin
REQUIREMENTS: Atari 400/800,XL's, XE's and a 5.25 in floppy drive.
NOTES: This is one of the best series of games that has been on just
about every computer platform at one time or another. This game is
considered to be rare. The box is intact, although one corner is
slightly bent. Everthing is in the box except for the metal Ankh. The
cloth map is pretty groovy just for hanging on your wall.
PRICE: If I get an offer that sounds good I will sell this or even
possibly trade it for C64 or Amiga items. So go ahead and make a bid.

////////COMMODORE RELATED HARDWARE\\\\\\\\\

ITEM: X1541 Cable
DESCRIPTION: This cable enables the user to hook-up a 1541 drive to the parallel port of you PC to transfer files (Like the ones you got off the web)
REQUIREMENTS: A 1541/1571 or compatable drive, A PC with a parallel port, a copy of Star Commander (available all over the web, just do a search)
NOTES: I have been transferring files from my PC to my commodore 64 for about a year and a half now. To make things easier I now have a 1541 drive attached to my PC at all times. I make these cables myself. They look good and are durable. They are also tested prior to shipping. I can make these in custom lengths (not to exceed 4 feet).
PRICE: $12

ITEM: Serial Cable
DESCRIPTION: You need one of these to use your floppy drive and your
commodore printer.
NOTES: I make these custom so you may specify a particular length you
require (not to exceed 4 feet). They look good and are durable. They are
also tested prior to shipping.
PRICE: $8

====================FLOPPY DRIVES====================
ITEM: Commodore 1541 Floppy drive
QUANTITY: 3
DESCRIPTION: 5.25 inch floppy drive (serial)
NOTES: Drive powers up lights come on. yet drive does not work, more
than likely an alignment problem. You may be able to re-align these by
using software and documentation Via the web(I have been lucky on
several occasions doing this), I just simply do not have the time to
mess with these. Worse comes worse they can ban used for parts for
another ailing 1541 drive. No power cable included(you can pick these up
at Radio Shack or most computer stores).
PRICE: $5 each.

ITEM: Commodore 1541 Floppy drive
QUANTITY: 1
DESCRIPTION: 5.25 inch floppy drive (serial)
NOTES: Drives work great. No power cable included(you can pick these up
at Radio Shack or most computer stores).
PRICE: $15 each or $20 with a power cable.

======================JOYSTICKS======================
ITEM: Wico Command Control
DESCRIPTION: This is a high quality joystick that has a fire button on
the base and one on top of the stick with a selector to switch between
the two. A great joystick that has an excellent feel to it, definately a
tool for the pro-gamer. Very clean!
REQUIREMENTS: For use on most 8 bit commodores and 8 bit atari including
the atari 2600
PRICE: $5.00

=====MISC. BOOKS/MANUALS=====MISC. BOOKS/MANUALS=====
=====MISC. BOOKS/MANUALS=====MISC. BOOKS/MANUALS=====

TITLE: An Introduction to Applesoft BASIC (Apple IIc)
PUBLISHER: Simon Schuster Publishing
Copyright 1985 376 Pages Softcover
NOTES: A complete guide to programming BASIC on the Aplle IIc using Applesoft Basic. Great for novices or experienced users. Also teaches you how to use the Apple IIc and a thorough explanation of ProDOS. Easy to read and understand.
PRICE: $5.50

TITLE: Advanced Turbo C
PUBLISHER: Borland-Osborne/McGraw-Hill
Copyright 1987 397 Pages Softcover
NOTES: Each chapter presents a complete discussion of a Turbo C programming topic, such as: sorting & searching - stacks, queues, linked lists, and binary trees - operating system interfacing - statistics - encryption and compressed data formats - random numbers and simulations - expression parsers - converting Turbo Pascal to Turbo C. This book is highly recommended!
PRICE: $8

TITLE: Turbo C Users Guide
PUBLISHER: Borland International
Copyright 1987 299 Pages Softcover
NOTES: The Official Comprehensive, easy to understand manual for Borland Turbo C for the IBM Compatable Computer. A very good read and excellent source of information on programming in the Turbo C language. Recommended.
PRICE: $6

TITLE: Advanced Turbo C
PUBLISHER: Scott, Foresman and Co.
Copyright 1989 451 Pages Softcover
NOTES: If you are familiar with the basic fundamentals behind Turbo C then this book will help you push the programming envelope even further. This book provides tons of sample programs and even covers many useful applications such as menus, data entry screens, sorts, binary trees, hash tables, and more. This book is great for those who want to learn advanced programming techniques. Highly Recommended!
PRICE: $8

TITLE: Discover the World Wide Web with your Sportster
PUBLISHER: Sams.net Publishing

Copyright 1995 154 Pages Softcover
NOTES: An informative listing of places to visit on the WWW, also teaches you how to navigate the web and use its resources. Mainly for use for those with a USRobotics modem, but any modem will suffice. Very good for the Net Beginner (NEWBIE).
PRICE: $1

TITLE: Fortran with Style - Programming Provebs.
PUBLISHER: Hayden
Copyright 1978 164 Pages Softcover
NOTES: This book is very cool looking. The cover is laid out to look like a farmers almanac. This book teaches good programming techniques in fortran and some examples to improve your programming with superior programming techniques. This book is great.
PRICE: $4

TITLE: Fortran IV, Introduction to
PUBLISHER: McGraw Hill
Copyright 1983 330 Pages Softcover
NOTES: Another great book on the programming language of fortran. An interesting peice of computing history.
PRICE: $4

TITLE: Mastering WordPerfect 5
PUBLISHER: Sybex
Copyright 1988 710 Pages Softcover
NOTES: If you own Wordperfect 5.0 and want to reap the full capabilities of the program, then you need this book. This book also includes a cardstock cheat sheet with all of the WordPerfect keyboard shortcuts. This book is definately a must. I wish I had this book when I first bought Wordperfect 5.0, it would have saved me countless hours. Highly Recommended!
PRICE: $10

TITLE: Computing Fundamentals WordPerfect 5.0/5.1
PUBLISHER: Addison-Wesley Publishing Co.

Howdy Tempest!

> Does anyone know of any cheats (ie. secret code numbers) or level warps
> for Bounty Bob Strikes Back (Atari 800 or 5200 version)?

i know only one cheat:

take the the flowerpot and hold "3" pressed in combination with START. You
will warp to level 4...

and by the way here some other populair cheats:

Donkey Kong jr:

go into pausemode press shift and type in "BOOGA"

then: S = next level
K = no collision

Henry's House:

press "cpm" (chris paul murray) in the title screen for endless live..

Ghostbuster:

name and bank number "LMAA","31562546" gives $999900.

Miner 2049er

press blind "2137826861"..press then shift 1-9 to change the level.

Anyone who remembers fondly finding a computer under the tree when they
were (insert age here)... or cutting grass for a year to finally hand
over the cash for their childish dream. Most people I know occasionally
stop and remember the good times. That doesn't necessarily mean they're
all behind us... but it's still nice...
If your question was rhetorical... please disregard this post ;-)

Once I got upset by a spammer who was sending me 5 messages a day, each in
triplicate. I tried sending the "remove" that the messages claimed would
stop the solicitation. Nothing. So I looked up the domain where the
messages were coming from, to complain about him to his ISP, and was
surprised by the fact that he was hosting his own services. From the
contact info on Internic, I got his number and *called him at work*.
I told him that I was going to call him every time I got a mail from him.
I was taken off the list immediately. Unfortunately you can't do that with
everyone, but that's the nice thing about administrating a mail server;
any time we get spam, I just add the domain to my "junkmail" rules and they're gone.

I was referring to the fact that for the reverse-engineering project
that Compaq
began they wanted 100% compatability. That is the acceptability I was
referring
to since other equipment like Heath used the same hardware but the Bios
was
different. (In this case pre-dating the IBM Bios.)

1105. FS: Atari 600XL Portland, OR

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-01 00:00:00 UTC
From: esallen@aracnet.com
Message-ID: <6b16j1man1@spitting-spider.aracnet.com>
Source record: 66459

We have an Atari 600XL in the original packaging, including power supply, TV switch box, owners' guide and Basic reference guide. According to the box, the system has 16k memory and Basic built in. The serial number label has 3 numbers: '83AEA' in small type, '130389' in large type, and '184' looks like it was stamped on. The box also has a sticker identifying the system as "The Official Home Computer of the 1984 Olympics".

We're offering the unit for sale to whoever makes a good offer first. Those of you who might not be in the market but would know the current market value of such a system, we'd appreciate you dropping us a line to tell us what you think it's worth. We're located near Portland, OR, but are open to shipping the system anywhere.

Actually, the best ways is to either ignore them, or if they REALLY get
bothersome, see what the postmaster at your ISP can do. Many times these junk
messages are trolls for Email addresses, and I'm already getting SPAMmed out
the ass by these bastards.

Spammers and other obnoxious morons cheerfully ignored.

[anti-copyright stuff clipped]

Why should I care what the FSF thinks of copyrighted software? Do you have
some opinion to express, or did you just feel like playing cut and paste?

> You really don't need to call people dirtballs.

Dirtballs are dirtballs. Why should I be apologetic for his behavior?

> I've seen really mean posts from you in the past, and for that reason I
> will never send you any money. I've stopped using your program so please
> save yourself some time by not talking crap about me.

I never posted anything about you. If you didnt like my opinion and
you decided to take it personally, thats your problem. If you are
RACK2000@aol.com, the only person I replied to, then I guess you
have a real reason to feel bad.

If I was ever nasty to anyone in this group without a reason I would
be the first to apologize. I dont recall ever insulting anyone for
kicks though.

> Get over yourself.

Your right, i'm such a egomaniac that I actually had the nerve to reply, and
then go way off the deep end using _sarcasm_ to drive home a point.

Your pointing out my egomania, combined with your clippings from the Free Software Foundations web page have brought me to my knees, and shown me the way to a better, meeker me.

Among the older VT-100 programs I'm familiar with, the only
really good one for Atari 8-bits was a 1983 mainframe emulator
called Chameleon, but I've only seen it on disk. (Note: this is
presumably NOT the same as some other program of the same name
that existed in the "IBM" world.)

You don't need to. Your Indus drive is a true double density-
capable drive. It's compatible with both true double density and
the "standard" single density. You can use the Indus to format
disks in double density and then copy all your single density disks
to double density. Those "DD" disks can then be read (or written
to) on your "IBM" compatible computer by using the "Util" program.
What 8-bitters refer to as a two-sided, double-density, 5 1/4-inch
floppy disk is the same density level that Beemers call 360K.

(For best use of the "Util" program, look around for the docu-
mentation file I compiled on it.)

->stuff on it, stored on mostly dd-atari-formatted disks (on a 1050
->with DOS 2.5).

I'm not familiar with the programs you mentioned, but your
troubles might be due to the fact that the souped-up density level
used by Dos 2.5 on the 1050 -- commonly, and more properly, referred
to as "enhanced density" or "1.4 density" (1,4 in European notation)
-- isn't the same as true double density (DD), which is a 360K total
for both sides of the disk. If you could find a true double density
Atari drive, you could copy your 1.4-density files into true double
density and then read those DD disks on your "IBM" compatible com-
puter using the "Util" program.

->stays off unless I'm using it. I've never had a problem with
->doing this ...

You seem to have been answering somebody else's question when
you posted this. The procedure you give is close to the theoretical
ideal but since the printer is a peripheral, in theory it would be
better to turn it on before powering up the computer so that your
Dos (and whatever program you may be loading in) can handshake with
the printer. (See "Your Atari Computer," by Lon Poole, et.al.)

In practice it doesn't matter most of the time, but in theory
this order would save having to hit the "system reset" key when
you turn your printer on in order to force the handshaking. This
may be more important when using non-Atari Company printers hooked
up thru an interface as opposed to being daisy-chained. With some
programs (like Atariwriter) hitting "system reset" causes no ill
effects, but there were other programs where this couldn't be done
because of possible data loss, and one would pay a price (like
having to do extra saves and rebooting) for not having turned the
printer on when booting up. I've long had two printers hooked up
to the 8-bit (one daisy-chained and one not) and have to make sure
one is "off" in order for the other to be turned on, so perhaps I
have more experience with the need to use "system reset" than users
of only one printer.

Are they that unreasonable? The last price quote I got from "today's market"
for an 850 was $39.95. Granted, it was in the box/manual/warranty format, but I don't think
$25 is so unreasonable. I bought the 850, and he paid the shipping as well. If it works,
I'll be really happy with the deal.

From: BobKlaas <bobkla19@sisna.com>
Message-ID: <34D48FC2.7FAD23ED@sisna.com>
Source record: 66471

Just a suggestion:

Don't spend the money for a power supply for the 1027 printer, not worth the money.

The original Atari Service manual advises you to change out the Mech when problems
crop up. This was the worst printer for the money they produced. There are several
direct connect printers much better than this one, and many dot matrix useable through an
850 or simular type interface that you will be much happier with the resulted printing.

And they are in the low price bracket..about as much as the power supply for the 1027.

Our computer club, the SLCC, had a Japanese member. I don't believe that
he was a serviceman or anything like that. Since he had to join a club
5000 miles away, I would guess that Japan was not a hotbed of Atari
8-bit activity.

Bob

1128. Atari Classics Magazine

Does anyone have any updated link to those who were publishing Atari Classics, i.e. Bob Wooley et. al. Is Atari Classics still being published? I had a brief lapse, but then sent in a check to get back aboard a looooooong time ago ... the check hasn't come back through the banks yet, and I have been singularly unsuccessful at contacting anyone about it.

Would you feel ok about printing your own currency if someone called
the Free Money Foundation agreed with you that it was ok?

Stealing is stealing IMHO. Just a difference of opinion I guess.

I called a thief a dirtball and a thief, nobody else. If he didn't want to
be called a thief in public, he shouldn't have been trying to do it
in public.

One of our user group members E. Terrance Madden brought in a photo
that
was taken in Russia. We magnified the image and saw the 8-bits being
used
as the computers and on the blackboard the programs were in ATARI BASIC!

As far as software from Russia, I haven't seen any....

I'm in Southend but don't have any 8bit stuff these days. I used to
virtually live in Maplin's in the early 80's drooling over all their 8bit
stuff and later on at 'Mike's Computer Shop' which had all the ST stuff.
Oh, happy days!

There is a big boot-fair down the A127 that used to have a lot of 800 &
600 machines and one guy used to have boxes full of 2600 carts at £1 each.
I must have bought 40 or 50 from him!

<SNIP>

I'm in Leigh-on-Sea (just round the corner as it were). Hmm. Bet he's no
longer there... Best place as I said round here is CC in Basildon, but
thats really only for hardware.

Dixons in Chester used to be the best place for Atari kit in the '80s
for me. I remember when they had a couple of 810 drives mispriced at
ï¿½40, Funnily enough, that's where mine came from. That drive is long
since dead, as is my old Atari 800. Although it was great to pick up an
800XL, I really miss my disk drive. Sitting there, fingers crossed while
the tape drive goes 'chug chug' reminds me of just -how much- ... Worth
it though when For Apocalypse comes up on the screen.

They also had a 520STFM in CC w couple of week ago for ï¿½30 (was very
tempted) but you can find better ST's for less in the small ads sections
mostly. They also had a Jaguar (which I think was the -first- 16 bit
console - way ahead of nintendo/sega). Seems people are also writing
games for it as well. I think that was about ï¿½20 so I might pick it up.
Dunno how good (apart from tempest 2000) they are tho'. And also whether
my Fiance wil let me have any more computers in the house...

It had some good games but its dead as a dodo since Atari closed down.
There are/was a handful of 3rd party games still being done for it but i
wouldn't hold your breath. Other good games were Iron Soldier,
AlienvPredetor and some rally game I really liked too.

Hello,

The APE 1.15 software works great, but sometimes the hardware
doesn't. I have an old IBM 386 clone and occaionally I have to reload
the COM drivers (Load Defaults, under the Z configuration menu) even
when it appears to come up correctly. This might be an intentional
flaw in the shareware version of APE, but only Steve Tucker would know
that.

If you are on COM2, APE doesn't like it at all. I wound up using COM1
and attaching my mouse to COM2.

>Hi all. Anyone know the proper uploading procedures if you want to
>contribute something to the archive?

Uploading

General uploading tips:
- No uploads may be made to the Archive's mirror sites.
- Please also upload a short text file describing what your upload is. You might also suggest what permanent 8bit subdirectory you'd like your file to end up in.
- Note that the 8bit/New directory is "write-only."

1) upload via AFS:
Just copy files into file:///afs/umich.edu/group/itd/archive/atari/8bit/New/

2) upload via FTP:
FTP to atari.archive.umich.edu, cd into "8bit/New", and upload your files.

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files (.arc, .com, .dcm, etc.) by FTP.

3) upload via E-Mail:
Simply uuencode the file and mail it to mailto:kendrick@zippy.sonoma.edu (Bill Kendrick).

Ascii Rider, I think you were asking for a registered copy of current very useful software that the author is selling. I draw a distinction between that and free circulation of 8bit titles of ten years ago. I think you were way out of line, and the last thing we need is for the author of the current stuff to see your comments and say "screw it. Not wasting my time anymore."

1154. SIO2PC problem SOLVED

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-03 00:00:00 UTC
From: Linda Shippert <loo@u.washington.edu>
Message-ID: <Pine.OSF.3.96.980203075940.1096A-100000@becker2.u.washington.edu>
Source record: 66333

Many thanks to all who responded with help for my SIO2PC cable woes! As it turns out; the cable was fine, APE works great, it was the serial port on the PC that was the problem. D'ohh!! Once I found a PC with a working serial port, everything worked like a dream.

1155. Monitor advice sought

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-03 00:00:00 UTC
From: Linda Shippert <loo@u.washington.edu>

Source record: 66334

Now that I have my SIO2PC setup running, I'm looking to improve what setup I have. Specifically, I'm looking for input about monitors.

Barrage of questions follows:

The FAQ mentions Commodore 1702 and 1804 monitors. Do these work well?

Where might I find one?

What are the advantages of using one of these rather than a TV?

Are there any other composite video monitors that anyone would recommend (and where might I find one)?

Thanks!

Yes, it is possible to use 2 modems on the 850, however it is too slow and you run into problems all over the place, everytime you run an operation you have to OPEN and CLOSE the port, you can in Fact Open R1:, close it, then Open R2: and close it and then go back and forth, but the 8-bit is too slow to continue this scanning process and perform disk read/writes and time updates, the system slows down soooo much, believe me I tried it back in 1986.

Yes they are very nice monitors if working ok. You might find one at
a thrift store or garage sale, though they are pretty rare
around here. I finally found one after 2-3 years of looking and then
had to pay a hefty price for it.

I lso have a Magnavox RBG display 80 that has a picture just as nice
as the 1702 in composite mode, and I only paid $5 for it :) Does RGB
as well, and has a green switch.

> What are the advantages of using one of these rather than a TV?

Better picture right off, and if you do the supervideo upgrades you will
see a major difference.

Just curious, if I revived either my web/ftp site or my dial-up BBS, which would you use?

Would you rather retrieve 8bit related material via the Internet or directly from an Atari 8bit based bulletin board system?

I want to put my Atari back into active service to the 8bit community, but my dial up BBS really never got my traffic, and an Internet site (being much more expensive) may not fare much better.

Please let me know your views.

I have two Commodore monitors, a 1701 and 1802. Both are excellent with my 130XE, and both came from garage sales. I've had the 1701 for about 4 years and paid $30 for it. In retrospect, I probably could have dickered it down to less, but ads in Ben Poehland's Atari Classics were offering Commodore monitors for $65. I had to get the person to break up a C=64 system to get it, so I had to offer enough to get her to do it. It was worth it to me, as I only had a video-only mono monitor or the family's second TV at the time. The only thing I've had to do with it is open it up to adjust the vertical position control.

We've had the 1802 for about a year. I paid $5 for it, and put it on my good ol' 800 for my mother to use. (She's trying to learn how to use a word processor.) No problems yet. I've seen only one other Commodore monitor at garage sales around here in 12 years, and that one wasn't working. I saw an Amdek packaged with an XL system at a Salvation Army store about 3 years ago, but they wanted too much for the system and I already have more computer stuff than I can fit in my house. I'm not sure now if the Amdek was a split-video monitor or not.

On the plus side, a composite color monitor also makes an excellent monitor for a spare VCR, using the A/V ports.

TJ

I would prefer a dial-up BBS, because I love the Atascii feel of the old boards. But, a home page would be cheaper for your users (who don't live near you) I know the costs are great for you, (I dont know how the web site would be more money than a BBS) The BBS needs the hardware and electricity and the extra phone line! Unless you hooked up with AOL and paying an arm and a leg for a web page! :)

Most dial up BBS' are really suffering these days. The Internet has all but destroyed the BBS.. (especially in my area for NON-PC boards)

heheh.. was that a recent picture? Atari's used in the classrom.. wow..
I think the last time that happened here in north America was maybe 1984.

I know the Atari 8bit had a strong showing in Poland.. especially when PC
prices were prohibitive.

Thanks, but I was feeling a little down about the atari stuff at the time..
one of the things I thought this ng was for was reviving the old atari games
in one form or another, and preserving them.. in the last 6 months I've had
xl-it, I've posted a few times about bounty bob, rescue at fractalus
problems, and ball blazers problems, and in 6 months, no one else has even
been interested in them, and I've got no clue as to how to get them to work
right on the pc... and I've already got my old amiga patched to my pc, and
don't want another old computer patched into it as well.. I was hoping
someone had tried to run the same programs, and figured out how to get them
to work.. rescue is GREAT at a MUCH faster speed on the pc, but not being
able to pick the pilots up kinda ends the game right there...

any help would of COURSE be appreciated!

Mat, thanks for the info...There was a bloke there ages ago (one of
the few days *I* could get out of bed) but he was on some very high
powered drugs, either that or a loon...

15 quid for a cart (basic) was what he wanted, unfortunately he did
not want the abuse I gave him for free :)

Hoping its a different bloke...Im sure he won't want to meet me again.

>If your question was rhetorical... please disregard this post ;-)

I think most of the "nostalgia" folks use emulators. I further think you'll find that the current users of the machines really use them! I can certainly say that the things I do with them now are infinitely more cool than the things I did 15 years ago. So while nostalgia is all fine and well, why not take the computers on their own merits?

It's kind-of like, I dunno, watching old movies, or listening to an old recording. Some people get into some kind of mood to watch or listen to a "good old" whatever. But "Notorious" and Benny Goodman and Jack Benny and whatnot surely stand tall on their own.

Finally, just to clarify my original message: I don't think there's anything inherently terrible about arguments or flamewars, any more than I think there's something terrible about two brothers fighting. The important point is that they can be friends afterwards; when it leads to bitterness and nursing of grudges, then it's bad news.

When someone gets a big stick in their butt, well, that's just not very healthy. And when, over the course of a few years, multiple people contract

SIB syndrome, well, bad things start to happen. Criticism and argument are no big deal; intransigent zealotry is a bigger deal. Perhaps it's all my imagination, but instransigent zealotry seems to be a little more prominent these days.

In short, I would hope that e.g. the Atari and C= folks can argue but still respect each other in the morning, and not descend into some sort of xenophobic existence.

There are no intentional flaws, they are all features <grin>. What happens
when you have this problem? Does APE just stop responding, or does it
fail to start?

> If you are on COM2, APE doesn't like it at all. I wound up using COM1
> and attaching my mouse to COM2.

Sounds like a hardware issue with your machine, perhaps your uart on com2
does not generate interrupts properly. There is no difference between
COM1 and COM2 to APE, just different base addresses and IRQ's.

1176. APE 1.16 Now Available

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-03 00:00:00 UTC
From: ai123@FreeNet.Carleton.CA
Message-ID: <6b668n$jk5@freenet-news.carleton.ca>
Source record: 66417

```
APE 1.16 is now available at http://www.nacs.net/~classics

I hope you enjoy it.

Steve
-
Summary of main program changes.

APETIME.COM now included free with APE.
Included on image APE_F32G.ATR
Source code available.
Downloads the PC time to the Atari and
updates the Spartados clock.
Compatible w/ both Spartados and Spartados
X.
Atari 800 and XL/XE compatible.

REMOTE.COM now included free with APE.
Included on both APE_F32G.ATR and
APE_WARP.ATR
Allows user to perform all APE functions
from the Atari keyboard.
Atari 800 and XL/XE compatible.
Compatible w/ all DOS systems.
See users manual for a complete description.

Feature [F]ind Image implemented.
Can recursively search an entire set of drives for any
image(s)

Path configuration now supports 10 'spider' paths.
Configuration Option [5].
Cables using the CTS line now supported.
Configuration Option [P].
Registered users can now use persistent sessions.
Configuration Option [Q].
Registered users can now bypass the startup screen
permanently.
Configuration Option [T].
Attempts to use Windows95 long filenames can be
manually disabled.
Configuration Option [U].
Force use of old smaller PC-MIRROR. (Spartados X)
Configuration Option [B/F].
R: Atari Modem emulation can be manually disabled.
Configuration Option [C/1-0].
```

Spider path settings.
Configuration Option [C/D].
Default search drive list for find and REMOTE.COM
Configuration Option [C/F].
Default filespec for find function.
Configuration Option [C/R].
Persistent PC-MIRROR path switch.

Summary of PC-Mirror changes.
Maximum file write size is now 7,864,320 bytes.
Old limit was 93,000 bytes.
Maximum read size is now unlimited.
Configuration Setting allows switch back to old small
image method.
Special SpartadosX 4.20 rom patch available on
request.
Mirror can now be swapped like any other image,
using keys 1-8.
Mirror path and filespec are now separate items.

Summary of APELOADER changes.
Now moves up a directory when backspace is
pressed.
Now executes APE macros on PC when Shift 1-0
pressed.
Complete loader rewrite, now totally relocatable
anywhere in memory.

Bugs Fixed in APE
Screen color corruption in menu Z/C fixed.
DCM Decompression code fixed.
Thanks to Ernest Schreurs (see IMAGIC.DOC).
Faster, more consistent, serial I/O routines written.
Keyboard buffer expansion code rewritten.
Problem with an international keyboard driver.
Work around for faults in Microsoft's Win95 serial
interrupt processing.
Could cause APE to stop responding when Win95
drops an interrupt.

Indeed. A lot of people winged it was 16bit in disguise but it had 3 64bit
processors, a 32bit one and a 16bit (for housekeeping/reading joystick).

> What was it about Atari? Years ahead of the competition, but they
> couldn't sell a bottle of whiskey to an alcoholic...
Exactly! They didn't do too much to encourage 3rd party software
initially as they wanted to make cash from in-house titles. By the time
they did, the playstation and Saturn were starting to show and developers
lost interest in Jag. Also, the dev kit was poor and the Jag can be a pig
to program, especially in assembler. It has some wierd architecture and
one really dumb hardware limitation to do with bus speeds which made some
stuff too hard to do effectivly.

Yup. He also worked for or at least wrote some stuff for Silica ISTR - some UK accounting software?!?! It was odd that a lot of people used to say Mike was activly seeking out pirates and reporting them. On the other hand, I know a few people who used to get all their stuff from him! (allegedly). He was one serious Atari fan though. Pity the shop didn't last.

Who was the young guy who used to work Saturday at Maplins in the early 80's? Used to sit there happily programming away with the Macro Assembler whilst answering questions and generally impressing people. I saw a few demos he did that blew me away at the time. Last I heard, he finished collage and was writing medical software.

Jon,
I have a 256K MI/O and use it at 19200 with Bobterm and a 14400 modem.
Works great. Somewhere there is a P:R:C patch that allows up to 19200.
I've never used it so I can't comment on how reliable it is.
Since the MI/O doesn't use hardware fow control, you must compensate
otherwise. I forget my settings at the moment as my MI/O is at home and
I'm not. There are a couple of settings for the modem and a couple in
Bobterm that need to be made. Anyway. it works great and I don't lose
any characters. If you don't make these compensation settings you will
lose characters and not be able to stop data flow quickly. I'll look
them up and get back.

Sorry AsciiRider, it was actually Rack2000 who was seeking a registered version of APE, which as I understand it allows you to use an old PC as a peripheral (hard drive, etc) for your 8bit.

Apologies.

I really believe that current authors for Atari 8 (both of them ;)) should have their rights respected, as far as respecting their limited version distribution, and paying up if you want the whole deal.

I remember buying Xformer over a year ago, when it still seemed to be worth a damn, and a friend wanted it, but I wouldn't make a copy because of respect for the rights of the author, that rude goon Mihocka.

When you switch on the computer it "asks" how's there. Hardware that's not ON can not respond.
As long as you switch on the computer last, the rest doesn't matter.

This is better asked in comp.sys.atari.st but I'll answer it anyway! If
you format the discs as 720K on the PC then both the ST and PC will be
able to read the same disk with no problems.

1189. Hyperspeed handlers

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-03 00:00:00 UTC
From: nisse-ma@reze-1.rz.rwth-aachen.de
Message-ID: <6b7d9p$13k$2@nets3.rz.RWTH-Aachen.DE>
Source record: 66430

Howdy Len

Are you the Len Spencer that wrote the Hyperspeed handlers for BB and MIO?

Are they online somewhere? I've tried to download them from Tom Hunt's side, but something in the address was wrong (document couldn't be found). I'd need the BB version.

Howdy Robert

Re: PRC

Is this a hardware or software patch

Re: MIO

It does support Hardware Handshake, but only Len Spencer knows how to switch it on. I've asked him for his Hyperspeed handler for MIO and BB.
I hear they speed both up.

Re: 850

It does support 19k2. I hope I remember to look up how when I'm home.
According to the manual it also supports hardware handshake. But nobody seems to know how to switch it on.

1191. How to go from bad bits to bad chips

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-03 00:00:00 UTC
From: nisse-ma@reze-1.rz.rwth-aachen.de
Message-ID: <6b7e4q$13k$4@nets3.rz.RWTH-Aachen.DE>
Source record: 66432

A couple a weeks ago, somebody said he had a bad chip. He even knew which bit had gone bad, but didn't know which chip represented which bit. This is what I found in the Operaters manual of CSS's Ultra Speed Plus OS.

primary 64 kB U9 - U16 bits 0 - 7
extended 64 kB U26 - U33

That' s for the 130XE. The 800XL uses U9 - U16 (same bits)

CU Mathy Van Nisselroy

I used the PRC for a short time, and hated it. It was well-known at the time where I was that it would give all sorts of modem lockups, weird printer errors, and that kind of thing. So far, I only saw it go to 9600.

>Re: 850
>

> seems to know how to switch it on.

It does, yes... I seem to remember a fellow who hooked up the computer directly to the 850 by way of hardware modifications or something like that, without all the cabling. The problem I have is that I'd like to help you guys on this, but I have no way of contacting the guy that did this, as it was around 1985 when I last had contact with him. My manual is deep in storage somewhere with all my other manuals.

James,
For me, the internet would be it. I'm not sure where you live, but I'm
pretty sure it is NOT Southern NJ.

Welcome to the comp.sys.atari.8bit newsgroup!

Atari 8-Bit Computers

Vendors and Developers List

"A comprehensive list of vendors, developers, publishers,
and repair shops for Atari 8-bit computers and their users"

Additions/suggestions/comments/corrections are needed! Please send to:

Michael Current
mailto:mcurrent@carleton.edu

Please refer to the latest version of this FAQ list whenever possible!

Available via these locations and Usenet FAQ archives everywhere:

http://www.faqs.org/faqs/atari-8-bit/vendev/

ftp://rtfm.mit.edu/pub/faqs/atari-8-bit/vendev

news:comp.sys.atari.8bit news:comp.answers news:news.answers

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
them in any way, are NOT listed here.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, PD/freeware/
shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the
developer are listed. No product can be developed by more than one
developer. No prices are given.
```

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Super-Brief Copyright Primer

Commerical software - protected by copyright, may not be copied except for personal archival purposes
Shareware -protected by copyright, may be freely copied and distributed, shareware payment required for continued use
Freeware - protected by copyright, may be freely copied and distributed, no payment required for continued use
Public Domain software - NOT protected by copyright, anyone may do anything with it, period.

Software is protected by copyright from the moment of creation. No copyright notice is required for copyright protection.

Software does not enter the Public Domain unless explicitly released to the PD *by the copyright owner*. If there is no copyright notice, software must be considered Freeware rather than in the Public Domain.

My article "Intellectual Property Protection for Computer Software" appeared in Atari Classics, 3(1), 1994, pp. 4-7, or see:
http://www.library.carleton.edu/staff/michael/acarticle.html

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

I collect information for this list from wherever I can find it. While most updates to this list come from you, the user of the list, I'd like to recognize a few of my more prominent sources:
- Atari Classics, published by Bob Woolley
- New Atari User, published by Page 6 Publishing (Les and Sandy Ellingham)

"Hi!" to Marek Tomczyk, who has supplied so much information from Germany.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this

list, please do your part in keeping it useful for everyone!

which
> would you use?

James, I love calling BBSs, as long as they're local or netted. PRO, Carina, etc. nets and the Fido National Atari Echo satisfied my needs for many years. It would be delightful to see all of that restored to its former glory, but we have to be realistic.

At a time when Internet access means a local call for most people, I think most would prefer to get their info, opinions and files that way. Of course, that means less 8-bits will be used to actually produce the information. I guess that's what has some purists upset. Others will argue that Macs and PCs are great tools for keeping the Atari 8-bit community alive and well.

At some point (hopefully in the far future) we'll be able to say which contingent, if either, was correct.

So, what would I advise you to do now? If finances allow it, I vote Internet.

Not always, Alan. One of my user groups, The Ol' Hackers, has been
international for many years. One man, our late past-president Alex
Pignato, seems to be personally responsible for that. Whether Alex did
this via networked BBSs (he was never a sysop, but a frequent caller) or
just word-of-mouth, it worked.

Actually, it's been something of a struggle to get any of the other local
members to use modems at all, but it seems our out-of-town members have
been doing it for a long time.

1198. Re: WTB: Power Supplies for 1050 DD and 1027 printer

I think I'll have to agree with Bob. I found a 1027in great shape - with an extra ?ink thingie? - minus the power supply. American TV doesn't have them. But - they are really cool looking. Wasn't it the only printer that matched the XL design? And they will fit just about anywhere! I guess it's just like anything else - fun! And, it makes it look like you actually used a typewriter doesn't it? :) Who needs a laser printer?

Agreed. However when the flame wars I did find it rather funny. I remember the same arguments when I was 14 and I am 30. It did bring back old memories, but we should get along now. Some of us, myself included own machines in both platforms......I dont think one is better, they are just different.

Having recently constructed a couple SIO2PC cables myself, I can vouch
that it is both a cheap and easy endeavour, provided you have an SIO and
serial cable. You can even replace the pcboard with a 14-pin chip socket
and you woudn't have to do any soldering, although it wouldn't be as
strong.

Just remember to test your PC's serial port before hooking it up to your
Atari!

> can find one? TIA...

I have one complete with parallel adapter, memory cards & all the
goodies. There's only one problem: the LCD is spiderwebbed; you can only
see a small corner of the screen. :) If you have the means of fixing it
I'd be glad to sell you the damaged unit.

Sincerely,
T.J. Mannos

Greetings Atari Users,

We have the following Atari 8-bit and Atari ST items for sale in the USA.
Every item is used original and is in good working condition.
Buyer pays for shipping.

ATARI 8-bit items
---

1. SpartaDos X Cartridge version 4.21 dated 7-10-89
No manual or box. Like new. Price-$25.00

2. SBM Small Business Management for Atari 8-bit Computers
Original disk, Notebook manual, Basic XL cartridge and manual.
Requires 2 Double Density Disk Drives. Price-$15.00

3. 11 Atari 8-bit software titles
MRCA Mach 2 / original disk and manual
Wayout / original disk and manual
Mad Magazine's Official Spy vs. Spy / original disk and manual
Asteroid Miners / original disk and manual
Round About / original disk and manual
Micro Shuttle / original disk and instruction card
Bill Budge PinBall Construction Set / original disk and manual
Raid over Moscow / original disk and manual
Menu Writer / original disk, manual and box
Cut and Paste / 2 original disks, manuals and folder box
Music Construction Set / original disk, manuals and folder box
All Eleven software items for $35.00

4. Omnitrend's Universe
2 Original disks and Large Black NoteBook manual
Hard to find game. Price-$30.00

5. Atari Remote Control Wireless JoySticks
Original Box, 2 JoySticks and Interface. No PowerSupply.
Intended for use with a 2600 system but will work on Atari 8bit.
Like new. Price-$10.00

6. Atari XDM121 Daisy Wheel Printer
Good condition. No manual or box. Prints well.
Price-$15.00

7. PQ The Party Quiz Game
4 push button controllers, Interface, 2 original game disks,
4 sets of extra game disks, Original manual and box
Hardly used. Price-$20.00

8. Animation Station
Drawing Pad and Pen, Original disk and manual
Like new. Price-$20.00

Atari ST Software
---
9. SuperCars II / Original Disk, manual and box
Price-$7.00

10. RamPart / Original Disk, manual and box
Price-$7.00

11. StormBall / Original Disk, manual and box
Price-$7.00

12. Tetra Quest / Original Disk, manual and box
Price-$7.00

13. Wanderer / Original Disk, manual, 3D glasses, and box
Price-$7.00

14. MindWheel / Original Disk and Book
Price-$7.00

15. Essex / Original Disk and Book
Price-$7.00

16. Total Recall / Original Disks, manual and box
Price-$7.00

17. Last Ninja 2 / Original Disks, manual and box
Price-$7.00

18. R.B.I. Two BaseBall / Original Disk, manual and box
Price-$8.00

19. Jewels of Darkness / Original Disk, manual and box
Price-$6.00

20. Damocles / Original Disk, manual and box
Price-$7.00

21. The Sentry / Original Disk, manual and box
Price-$6.00

22. Q-Ball / Original Disk, manual and folder box
Price-$7.00

23. Mortville Manor / Original Disks, manual and folder box
Price-$7.00

24. Into the Eagles Nest / Original Disk, manual and folder box
Price-$6.00

25. Cloud Kingdoms / Original disk, Poster instructions and box
Price-$7.00

26. Monster Pack Volume 1 (includes 3 games)
Shadow of the Beast 1
Infestation
Nitro
All original disks, manual covering all games, and box
Price-$10.00

27. Zork II / Original disk, manual, box, and etc.
Price-$6.00

28. Zork III / Original disk, manual, box, and etc.
Price-$6.00

29. Zork Trilogy / Original disk, manual, box, and etc.
Price-$9.00

30. Beyond Zork / Original disk, manual, box, and etc.
Price-$7.00

31. A Mind Forever Voyaging / Original disk, manual, box and etc.
Price-$7.00

32. WishBringer / Original disk, manual, box and etc.
Price-$7.00

33. SpellBreaker / Original disk, manual, box and etc.
Price-$8.00

If any one is interested in purchasing either all Atari 8-bit or Atari ST
items at once, then make us an offer.
Also we have alot of Used Original Atari 8-bit and Atari ST software that
is not on this list. So if you are looking for a item(s) that isn't listed
then just ask, we may have what you're looking for.

Thanks and contact us at the following address.

<Mknzy@webtv.net> wibbles merrily:
>Agreed. However when the flame wars I did find it rather funny. I
>remember the same arguments when I was 14 and I am 30. It did bring
>back old memories, but we should get along now. Some of us, myself
>included own machines in both platforms......I dont think one is better,
>they are just different.

Hmm. As no doubt most us own PC's with Bill Gates favourite operating
system plastered all them...

Perhaps we could unite Atarians and Commodore (pah!) owners in
remebering just how god-awful the BBC Model B and squishy keyed, blocky,
vile, ZX Spectrums were.

I alwats rember smugly smiling while showing my Speccy owning friends
just -how much better- my Atari Graphics, Sounds, Games etc. were (same
applies to the C64 - I belive Necromancer was out on both platforms...)

how to
>> do it. I did mine from the text file and it works just fine.
>>
>Cool!!! I could not find the text file though. Can you tell me where it
>might be?

John: I highly recommend the CSS (Bob Puff) XF-551 dual drive uprgrade kit. It is a replacement rom and additional circuitry to allow the XF-551 to access both drives without having to use switches. The 5.25" mechanism operates as D(n): while the 3.5" mechanism operates as D(n+1):. Have had one of these for several years without a problem, although it doesn't get that much use anymore.

Atari 130XE with power supply and Video cable $35.00 Shipping included.

Atari 800XL with power supply and video cable $25.00 Shipping included..

Atari 850 Interface, comes with power supply and Printer Cable $25.00
Shipping included.

KPI-Hard Drive Intercace attaches to a 800XL through the PBI port access
Scsi drives
that reads and writes 256k bytes per sector, or MFM type drives 10mg
through 96mgs attached
to an Adaptec 4000, 4000a, 4070, or a 5500, this interface at this time
is Rom controled and I would need to know what drive is being attched to
the interface so the Rom could be set for your drive. There are
upgrades being explored for this interface one being a add on board to
give it MIO type addressing drive type from the screen and also the
posibility of a CD-Rom drive being implimeted on the system. These are
not vapor ware I have the board for the mio screen update here but the
cd rom is still in development. Price as it stands today Rom
Controled. $80.00 plus $4.00 shipping and handling.. Purchasers will
receive update informatin as it becomes available.

Indus Double Density Disk drive...$25.00 Shipping included..comes with
power supply and
sio cable.

Unanimous so far, looks like.. I like the hands-on style of the BBS...
but as far as access goes... unless you're near Birmingham AL... I would
be priced out of there.

1218. Keyboard hardware questions

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-05 00:00:00 UTC
From: dpeschel@u.washington.edu
Message-ID: <6bb85v$17j8$1@nntp6.u.washington.edu>
Source record: 66372

Hello,

I'm new to this newsgroup (though I have plenty of experience with USENET and computers). I grew up with the Apple][but I'm now playing with a few Atari emulators. It's really interesting to compare the designs of 80's machines (Apple, Atari, Commodore, Acorn) to see how they all resolved the same design issues.

I've read the Atari System Manual and quickly looked at a couple of users' guides, and the source to a couple of emulators. I'd like to really understand what's possible and impossible with the keyboard hardware. Would someone mind correcting me if I'm wrong?

- There are a few different physical arrangements of keys: 400/800, 1200XL, 600XL/800XL, XE's.

- Theoretically, a keyboard can be viewed as a matrix of independent switches, so there are 2^n possible states where n is the number of keys. But no 8-bit Atari provides software or firmware access to this representation.

- Instead, there are a couple of different kinds of keystrokes:

The RESET and BREAK keys generate immediate interrupts. (Is it possible to distinguish what keys were held down when RESET or BREAK was pressed?)

The state of the SELECT, OPTION, and START keys can be read at any time (because they are "console switches" as on the 2600).

Most other keys send an internal code along with the state of the Control and Shift keys. It is not possible to detect Shift or Control by themselves, or distinguish between the two Shifts.

```
esc 1 2 3 4 5 6 7 8 9 0 < > backspace
tab q w e r t y u i o p - =
a s d f g h j k l ; + * return
z x c v b n m , . /
space caps atari
```

I assume the keycodes are the same on all keyboards.

- All machines except the 400/800 have a HELP key. It acts like the letter keys above (sends a keypress, along with Control and Shift bits) but to a different memory address.

- Only the 1200XL has F1 F2 F3 and F4. They behave the same way as the letter keys and HELP (only keypresses can be

detected, with Shift and/or Control). Only the 1200XL has
a software-controlled LED.

Thanks for your help,

-- Derek

1219. Do you know Brent Murphree? (smurphre@bellsouth.net)

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-05 00:00:00 UTC
From: Daniel Woodard <woodardd@dma.org>
Message-ID: <6bb7ka$14b$3@sally.dma.org>
Source record: 66373

I just wanted to know if any of you out there have had dealings with Brent Murphree? (smurphre@bellsouth.net) Last fall, he and I had a trade worked out, where I was to send him an Atari Lynx II and 5 games, and he would send me a Super Nintendo, 5 SNES games, and 4 game boy games. He is the one who posted the initial posting in the atari newsgroup, saying that he was really desperate to find a good used Lynx II, and several games for the system. He also specifically said how many games he would be sending along with the SNES and the Super game boy. Well, when he actually sent the items, all I received was a SNES, Super Game Boy, two SNES games, and two trashy, almost unplayable game boy games. He did not include 4 SNES games, and also left out 2 of the game boy games that he had promised.

So, I e-mailed him, asking him what was going on. He mailed me back and said that he had to send the rest of the games in another box, since there wasn't enough room in the first one. I waited a few more days, but nothing showed up. I mailed him again, and this time he claimed that he had sent them Federal Express (first time he said U.S. postal service), and that they had somehow lost the package, and he didn't know what to do.

I wrote back again, and he explained that the package was supposedly insured, and they had given him $50 because it had been crushed, and the items destroyed, but he said he was uncomfortable sending cash through the mail, and didn't know what to do. By this time, I was very suspicious, because I had started to notice that his story had changed slightly several times. I asked him for the tracking number of the package, but he refused to acknowledge my question. Thereafter, every time I e-mailed him, I made a point to let him know that I required the shipping number on his insurance receipt, but not once did he even acknowledge my asking him for the tracking number for the package. I even explained that I would need the number to verify that he had even sent out the games in the first place.

Eventually, he started to claim that he was only a youngster (not even a teenager yet) and that his allowance was all used up, but that he could use the insurance money to buy me replacement games. However, he said that he would only be able to ship the games if I would send more money to pay for shipping. I thought about this for a bit, but then realized he would probably just laugh and use the stamps I sent for personal purposes. I felt had, with no way to get what I had been promised.

Sure, the trade deal that I had been promised sounded very good, but I never do trades unless they are in my favor. Brent made a point to continuously mention that even without the rest of the games, he felt like our trade had been fair, because he had supposedly checked respective prices on the net. My point to him was that he had promised me certain

games, but had failed to keep his half of the bargain, even though I had kept mine to the letter. I tried to explain to this guy that you don't change the rules of the agreement after one person has already sent their merchandise.
Anyway, I guess the main reason I am writing and posting this warning is because out of all the deals I have done on the Internet, this man was the most ruthlessly immoral. From what I saw, it seems that he would stoop to almost any level in order to screw a person out of what they deserve. I doubt very much that he is a 12 year old, and even if he is, that is still no excuse to promise something in a deal and then only send half of what you promised a person. Brent Murphree is without a shred of decency or integrity, and I urge you to avoid doing business with him at any cost. If you have had business dealings with Mr. Murphree in the past, I would appreciate it if you would e-mail me and share any experiences you might have had with him.

Thanks,

Dan Woodard

1228. DCM / Diskcomm file format specifications revision 1.0

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-05 00:00:00 UTC
From: ernest@wxs.nl
Message-ID: <34da3fac.87226@news.wxs.nl>
Source record: 66382

Here are the specifications for the Diskcomm file format.
Sorry that this post is rather long, but over time, lots of people
have asked for it, so I hope it will be appreciated anyway.
Please send me some feedback if you think this text is unclear.
Keep those XL's/XE's humming.

Diskcomm file format version 3.2, revision 1.0, February 1998.

Diskcomm archives represent the contents of diskettes used for the
Classic Atari computers. Various pieces of information related to the
format and the contents of the diskette are stored in the archive
file. To reduce the storage space requirements, compression
algorithms are applied to the data. For some large archive files, it
may be necessary to split the archive into multiple files, in order to
be able to store the archive on diskettes.

On an Atari disk, data is organized in sectors. These sectors are
numbered starting from 1. There are various disk sizes. The most
common ones are the standard diskettes. Common diskette formats are
the single density diskette, which holds 720 sectors of 128 bytes, the
enhanced density diskette, which holds 1040 sectors of 128 bytes, and
the double density diskette, which holds 720 sectors of 256 bytes.
There are various other formats, but the single density and the
enhanced density are used most, since these are supported by the 1050
disk drive. Other formats require a XF551, 815, or some third party
disk drive, like the Percom, Indus GT, Trak, Black Box with floppy
board, MIO, and the HDI, to name just a few. Diskcomm will always use
1040 sectors for enhanced density diskettes, so for this type of
format, the number of sectors processed is defined by the format. For
single density and double density disks, the maximum number of sectors
can be modified between 1 and 9999. By definition, the first three
sectors of any Atari disk contain 128 bytes, since this is considered
the boot area. So the first three sectors of double density disks
will also contain only 128 bytes of data. Diskcomm still stores these
sectors as sectors of 256 bytes within the archive, and the remaining
128 bytes will simply contain zeroes.

The sectors of a disk are stored in the archive sequentially. Sectors
of data within a Diskcomm archive are compressed. While creating the
archive, Diskcomm examines the contents of each sector that is
processed. Based on these contents, one of several compression
algorithms is used to reduce the amount of storage required for
representing the contents of this sector. Sectors that contain
nothing but zeroes are considered empty sectors. Empty sectors are
not stored in the archive. A flag will be set in the information

stored for the preceding non-empty sector, to indicate this. This preceding sector will be followed by the sector number of the next sector that contains data. It is assumed that the diskette will be formatted before writing the archive back to a diskette, and thus that initially all sectors on the output disk will contain zeroes. Therefore, there is no need to store empty sectors in the archive. To be able to skip these sectors when writing the archive back to disk, the sector number included in the archive is used to skip these empty sectors.

For sectors that contain data, the contents of the sector are compared to the contents of the last preceding sector containing data. Empty sectors have no influence on this comparison, since they are skipped. Like noted before, there is a flag that indicates that a sector number follows the sector data. If this flag indicates that a sector number follows the sector data, the number of the current sector is appended to the archive buffer, in the 6502 low/high byte format. Then an attempt is made to compress the current sector. There are four different compression algorithms that can be applied. Each of them is applied to the sector in turn, and if the result is successful, the resulting compressed data is appended to the archive buffer, with the type of compression pre-pended. Older versions of Diskcomm used a fifth algorithm. This is now obsoleted by one of the remaining four algorithms, so this old algorithm is no longer applied when an archive is being created. However, some very old archive may still contain a sector that was compressed by this algorithm. If the sector data cannot be compressed by one of the four algorithms, the data is stored uncompressed.

Compression of sectors continues until memory runs out, or until there are no more sectors left to process. Due to memory limitations, there is a maximum of just over 24K of data that can be stored in the archive buffer. When appending the compressed data to the buffer causes the buffer to contain about 24K of compressed data, the buffer is full, and it is flushed to disk. A system that has more than 64K of memory can hold multiple buffers before the data is actually flushed to disk. Each buffer load is considered to be a pass in the compression of the disk. A pass is an undefined number of compressed sectors, that is considered complete when hex 5F02 (dec 24322) bytes of data or more has been accumulated. The end of pass information is then appended to the pass. A pass must be no larger than hex 6002 bytes. Each pass starts with the header, which consists of two bytes. The first byte is either hex FA or hex F9. When the archive is split up into multiple files, this byte will contain hex F9, otherwise it will contain hex FA. The second byte of the header combines three pieces of information. The format of the original disk is indicated in bit 5 and bit 6 of the second byte. Bit value 00 is used for single density disks, bit value 01 is used for enhanced density disks, and bit value 10 is used for double density disks. Bit value 11 is undefined. Bits 0 to 4 are used to indicate the pass number. Each pass is numbered sequentially, starting at 1. since there are 5 bits

available for this, the highest possible pass number is 31.
Therefore, the largest archive will be no larger than 31 times 24K,
unless the pass count is allowed to roll over to zero. The high order
bit of the second byte (bit 7) is set when this pass is the last pass.
Since compression is started before asking what the user wants to do,
the question of dividing the archive into smaller files is only
presented to the user if there is more than one pass. If all data can
be stored in one pass, this question is not presented, and an archive
with header type hex FA is created. The first sector within a pass
will always be preceded by its sector number.

Format description, values are in hex:

<Diskcomm archive> = {pass}
<pass> = <archive type> <pass information> <sector number> {sector
data} <end of pass>
<pass information> = <last pass flag> + <diskette type> + <pass
number>
<sector data> = <content type> [compressed data] [sector number]
<content type> = <sequential flag> + <compression type>
<archive type> = F9 | FA
<last pass flag> = 00 | 80
<diskette type> = 00 | 20 | 40
<end of pass> = 45
<sequential flag> = 00 | 80
<compression type> = 41 | 42 | 43 | 44 | 46 | 47
<sector number> = 0001 - 270F
<pass number> = 01 - 1F
<compressed data> = Sector contents, see below.

Format description in plain English.

Diskcomm archive: A Diskcomm archive consists of one or more passes.
When an archive is split into multiple files, each pass is stored in a
separate file.
Pass: A pass consists of an archive type code, followed by pass
information, followed by the starting sector number, followed by one
or more sector data packets, followed by the end of pass code.
Archive type: The archive type indicates whether this is a multi file
archive (F9) or not (FA).
Sector data: A sector data packet consists of one byte that indicates
the content type for the sector data packet. After the content type,
the compressed data for the sector follows. The contents of this
depends on the type of compression, and it can contain any number of
bytes, from zero up to the length of the sector for the type of disk,
either 128 or 256 bytes. The high order bit of the content type is
used to indicate whether or not a sector number will follow the
compressed data. If this bit is zero, a sector number will follow the
data. If this bit is one, there will not be a sector number following
the compressed data.
Sequential flag: This flag indicates whether or not the sector packet

contains a sector number. If this flag has the value 00, a sector number will follow the sector data. If it has the value 80, there will not be a sector number following the sector data, and the next sector is the next sequential sector.
Content type: The high order bit of this byte is the sequential flag. The remaining low order bits are the compression type.
Sector number: An unsigned sector number, which is two bytes. The first byte is the low order portion of the number, the second byte is the high order portion of the number. Normally ranging from 1 to 9999 decimal.
Pass number: A sequence number assigned to each pass. Normally ranging from 1 to 31 decimal. This might roll over to zero after 31.
End of pass: The value hex 45.
Compression type: One of the following hex values: 41, 42, 43, 44, 46 or 47. The meaning of these values is described below.

Type 41, modify begin.

The compression is relative to the previous sector. The sector data contains only the beginning portion. The last portion is not changed. The first byte of the sector data specifies at what offset to start modifying the sector. The remaining bytes of the sector data are used to modify the beginning portion of the sector. This modification takes place starting at the byte at the start offset, working towards the beginning of the sector, up to and including the byte at offset zero, the first byte of the sector. This implies that the data bytes are stored in a reverse order in the sector data.

Type 42, 128 byte DOS sector.

This is an obsolete compression type, that was used by early versions of Diskcomm. Earlier versions of Diskcomm supported only single density diskettes, so this type of sector always represents 128 bytes. Programs that decode archives should be aware of this. Using it for creating new archives is not recommended. The sector data contains five bytes. The first byte of the sector data is used to initialize the first 124 bytes of the sector. The remaining four bytes are stored in the last four bytes of the sector.

Type 43, compressed sector.

The sector data contains substrings. These substrings alternate between uncompressed and compressed, starting with an uncompressed substring. Each of these substrings starts with a byte that specifies the ending offset of the resulting data in the sector. When this ending offset position is reached, the end of the substring is reached, and the byte at this ending offset is the starting position for the next substring. The starting position for the first substring is at offset zero. An uncompressed substring will contain as many bytes as are needed to fill the sector from the start position up to, but not including the end offset. For uncompressed substrings, if the starting position offset is equal to the ending offset, there is no

further data, so in effect, this is a null string. This is used when there are two portions of data within the sector that can be compressed, without other data in between these portions. The uncompressed substring must be present, therefore a null string must be used in this case. Compressed substrings are always two bytes in length. The compressed substring starts with a byte that indicates the ending offset. The second byte contains the fill character. The portion of the sector starting at the start offset, up to, but not including the ending offset, is set to the value of this fill character. After the compressed substring, another uncompressed substring follows.

For double density disks, the ending offset for the last substring is 256. Since there is only one byte to represent the ending offset, this is stored as zero. However, zero is an offset that can be used for the first uncompressed string, to indicate that the first uncompressed string is a null string. The end of this type of compressed sector is reached when all bytes in the sector have been processed. This can occur at the end of an uncompressed substring. In this case, there will not be a compressed substring following the uncompressed string. Likewise, if it occurs at the end of a compressed substring, there will not be an uncompressed string following it.

Type 44, modify end.

The compression is relative to the previous sector. The sector data contains only the ending portion. The beginning portion is not changed. The first byte of the sector data specifies at what offset to start modifying the sector. The remaining bytes of the sector data are used to modify the ending portion of the sector. This modification takes place starting at the byte at the start offset, up to, and including the last byte of the sector.

Type 45, end of pass.

This compression type indicates the end of a pass, so it is not a real compression type. There is no sector data for this type. For a multi file archive, this indicates the end of the file. The archive is continued in the next file, unless this pass was the last pass. For single file archives, this indicates that the next pass follows within this file, unless this was the last pass. The next pass starts with a header again, followed by a sector number.

Type 46, same as before.

This compression type indicates that the data for this sector is identical to the data of the previous non-zero sector. There is no sector data for this type.

Type 47, uncompressed sector.

The sector data contains the number of bytes required to fill an entire sector, either 128 or 256 bytes. No compression of any kind is performed on this sector type.

Previous sector.

The buffer that holds the contents of the previous non-zero sector is initialized at the start of a pass if the archive is a multi file archive. For single file archives, this buffer is cleared at the start of the first pass only.

Known bugs and anomalies.

This specification induces some anomalies. When the last sector in a pass has the flag set that indicates that a sector number must follow it, this sector number has no meaning, since the next pass will always start out with a sector number. Diskcomm might not have the next sector available. Therefore, it cannot always determine whether or not it is an empty sector. Since a sector number must be included once we set this flag, a fake sector number is appended. The value hex 0045 is used for this. This is also true for the last pass. Note that this is stored in the low/high byte order.

Diskcomm processes sectors in chunks of 18 sectors, or chunks of 9 sectors if the disk is double density. These chunks might include empty sectors. The last sector in these chunks will always be followed by a sector number, since Diskcomm does not read ahead to determine the contents of the next sector. This is not a requirement. On creating an archive, Diskcomm just happens to do this. So a sector number might be included even if the next sector is non-zero.

It looks like Diskcomm has some slight problems. Double density sectors are 256 bytes long. If the buffer contains hex 5EFF bytes, and the sector cannot be compressed, and a sector number must be included, we must add 259 bytes to the buffer. To mark the end of pass, we have to add either one hex 45 byte, or hex 45 00 45. This might add up to three extra bytes. The pass would be hex 6003 bytes long. This makes the pass longer than hex 6002 bytes. On reading, this is also a problem. Diskcomm will not store the first two bytes, since the two header bytes are read and processed first. Then it tries to read hex 6000 bytes. Within these hex 6000 bytes, the end of pass code must be included. This will be missing though, so Diskcomm will not be able to process the file. This problem only occurs with double density disks in the specified exceptional conditions.

When a pass contains exactly hex 6002 bytes, Diskcomm will terminate processing after this pass. Therefore, passes should be less than hex 6002 in length. This can only occur with archives of double density disks.

For unknown reasons, the passes above pass number 31 have their pass number reduced by one. Only the five low order bits are stored.

For multi-file archives, a selected character of the filename is
incremented for each pass. This will eventually cause an invalid
character to be used in the filename, depending on the restrictions
imposed by the DOS used.

> make backups of these programs using a atari 800 and a indus drive
>
For non-copy protected disks, i use SCOPY (sector copier), or Disk Wizard
II. i have one disk that i notched to use both sides and have both pgms
on the same disk. SCOPY is only about 7 sectors long. (i think) and boots
real quick even on the slowest drive/computer combo... (as opposed to a
warp-speed-type boot disk)

1231. need help with POKEY timer emulation

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-06 00:00:00 UTC
From: Petr Stehlik <pstehlik@zln.cz>
Message-ID: <6beoe1$3rs$1@ns.felk.cvut.cz>
Source record: 66290

Hi,

I have been working on improving David Firth's Atari800 emulator for last six months. Several things has been fixed, some bits were improved, changes were sent back to David - so hopefully there soon will be a new version of Atari800.

But now I need to emulate Pokey timers in order to get Ghostbusters (and other games) running. Unfortunately I don't remember the hardware details of the timers (if they're restarted automatically etc). Could anybody help me, please?

Petr

If you see anything you want, need, etc MAKE an offer. (I prefer not to
set prices.)

If anyone wants to make an offer on the lot, go ahead....
people won't laugh at you (much!).

Buyers will be responsible for all shipping/handling charges.
Sales to contiguous US only.

Atari Games for Sale

(All complete with boxes and documentation, unless otherwise noted)

Cartridges

**Atari

c Centipede Zap the worm and all his parts. Arcade
game.

c E.T. Phone Home *SOLD* Help E.T. find the parts to make
his phone.

c Missile Command *SOLD* Save your cities from alien attack.

c Star Raiders *SOLD* Some more stupid spaceships!

**Imagic

c Atlantis Missile Command under water.

c Demon Attack Space Invaders with flapping wings.

**Spinnaker (once again, nice but heavy premium plastic packaging)

c Fraction Fever Shouldn't 98.6 be 98 3/5 ?

c Story Machine Kind of a "mad lib" for your kids.

**Thorn EMI (Once again, neat little BETA boxes)

c Kickback A soccer-like breakthru game.
Did I mention soccer is like unto
great gasping intakes of air!

c Jumbo Jet Pilot Take your seat at the controls of
a jumbo jet. Fly it upside down...
see passengers grab for Gravol...
mess up the President's $200 haircut..
console Bobby because they shot his

dog before boarding.... JUST KIDDING!

**AIM Software

t X-Ray *SOLD* Art construction game

**Atari Corp

t States and Capitals Program cassette ONLY, Instructions and
game on tape.

**Cosmi

t Aztec Challenge Seems to be "Mountain King" type game.

t Caverns of Khafka typical cavern-tomb danger graphics
game

t The Crypts of Plumbous A lot like "Defender", as I recall.

t Forbidden Forest Find your way out of a deadly graphic
forest

t Galactic Avenger "Space Invaders" type game

t Professor IQ Series of educational learning games

t Slinky You've played with the springs, now try
them on the screen!!

t Spider Invasion Destroy deadly spider mutations, their
eggs and nest. Are you getting as
itchy as I am?

**Edu-ware Services

t Compu-read 3.0 Tool for improving reading speed and
comprehension. NOT boxed, but in it's
own folder including docs.

**EPYX

t Curse of Ra Expansion module for "Temple of Apshai"
adventure game. Book of Lore missing.

**Program Design, Inc.

t Addition with Carrying Math games for the young. In clear
plastic sleeve.

t Sam the Sea Serpent Sammy will devour your child if he
gives the wrong answer! (Just Kidding
!!). A story and game for your young
~~~~~~~~

ones.

**Thorn EMI -- love their packaging....beta-like plastic containers
(and we all know where beta is)

t Compute 4 & Reversi Connect-4 game and "Go" type game

t Cribbage & Dominoes Cribbage & Dominoes...get the idea?

t Darts So safe, you can even throw them at
your Mother-in-Law

t European Scene Jigsaw Like those plastic toys where you
Puzzles Vol2 slide the tiles to get the picture
together.

t Figure Fun Two games to teach multiplication,
division, etc. Five levels, cover most
ages

t Owari & Bull and Cow *SOLD* Computer renditions of traditional folk
games

t Pool Everybody in the Pool !! No, not that
kind -- tournament and eight-ball,
practice included.

t Snooker & Billiards Pool with fewer balls and no numbers.

t Super Cubes and Slip Rubik's Cube and marble maze in
computer form.

DON'T TELL *ME* YOU HAVEN'T HEARD 5-1/4" FLOPPIES MAKE GREAT VALENTINE
GIFTS!!!!

5-1/4" diskettes

**Atari Program Exchange

d Galahad and the Holy Grail Fairly well known adventure game, in
SOLD ziplock packaging.
~~~~~~

d Seven Card Stud Monty Webb's poker game. Ziplock
packaging.

**Avalon Hill

d Divex Another darned "teach your kid" number
stuff... don't YOU ever sit down with
him??

**CBS Software

d Success With Math: Math for grade levels 5-8
Fractions

d Success with Math: Grade levels 7-11
Linear Equations

d Success with Math: Grade levels 9-12
Quadratic Equations

**Cosmi

d The E Factor Save your planet against mimes, aliens
and asteroids!! Sorry, Marcel, oops,
that's "Mines"

**Crystalware

d Imperial Walker Idiotic robot elephant from Star Wars

**DataMost

d Ardy the Anteater Anteater slurping up those ants !

d Night Raiders Blow up the alien spaceships
again...don't they ever give up?

d The Tail of Beta Lyrae Lyrae is blow up the spaceships you
& Round About missed before, Round About .. blow up
strange shapes. Two games in one
ziplock. ~~~

**EPYX

d King Arthur's Heir Camelot adventure game. Has nothing to
SOLD do with Royal toupees.

d Temple of Apshai Base for other DUNJONQUEST games.
Includes both cassette version and
5 1/4" disk.

d Upper Reaches of Apshai Another expansion module for Temple of
Apshai. Book of Lore missing.

**Hayden Software

d Final Conflict Futuristic tank warfare game
SOLD

**K-TEK

d Gorgon Rescue the Golden Fleece with Jason,
beware Medusa, beware this game... it's
Booorrrrriiiinnnggggg.

**KeyPunch Software

d Strategy Simulations Robot Patrol, Star Merchant, Civil War,
SOLD Convoy. Sure sounds like public domain
games to me ! In plastic sleeve.

**Learning Company

d Word Spinner Basic building blocks of reading, ages
SOLD 6 - 10. In cardboard folder.

**Main Street Publishing

d Ardy the Aardvark Same game as above, repackaged in
ziplock.

**Penguin Software

d The Quest **SOLD** Fairly decent graphic adventure game

**Scholastic

d Agent USA Educational puzzle solving adventure
for ages 9 to adult. Nice, but heavy
packaging.

d Turtle Tracks LOGO-type graphics language program
for ages 9 to adults. Also nicely but
heavily packaged.

**Sirius

d Blade of Blackpool **SOLD** Illustrated myth and magic graphics
adventure game. Not bad.

d Fast Eddie Jumpman, Donkey Kong type arcade game.

d Wayout Colorful elaborate maze game. Still
has the CLOWN glasses !!

**Spinnaker (Heavy plastic box packaging...nice, but probably
expensive to mail !)

d Kinder Comp Collection of six educational games.
Boy, are your kids going to be smart !!

d Snooper Troops, Case #1 Kids detective game. Teaches problem
SOLD solving, deductive skills

d Snooper Troops, Case #2 Are your kids skilled yet? If not, try
SOLD this one too.

**Thorn EMI

d Home Financial Management If you buy all the above, this will
help tell you how much over budget you
are!!

**Walt Disney PC Software

d Mickey & the Great Outdoors If your kid can only learn from a
mouse, this is the one to do it.
More math and literacy skills.
By the way,
BOYCOTT DISNEY/ABC !!!

OK! I KNOW A SMALLER PERCENT OF OUR POPULATION IS LITERATE,
TEST SCORES HAVE FALLEN, WE'VE DROPPED TO 17TH IN EDUCATION...
SINCE THE ESTABLISHMENT OF THE DEPARTMENT OF EDUCATION and
CONTINUAL NEA 'STANDARDS'.
IT DOESN'T MEAN *YOU* CAN'T TRY READING!!!

Hi,

I'd like to buy the following Atari Ultima Games:

Ultima I, Ultima II, Ultima III & Ultima IV

Thanks,
Steve

1234. WANTED: Autoduel

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-06 00:00:00 UTC
From: Linda Shippert <loo@u.washington.edu>
Message-ID: <Pine.OSF.3.96.980206091302.3677A-100000@becker2.u.washington.edu>
Source record: 66293

I'm looking for AUTODUEL, either actual disks or a good image. The images and the Hackerz archive don't seem to be working (they crash when I try to enter the arena). Thanks!

1235. binary load overwriting dos?

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-06 00:00:00 UTC
From: crow@coos.dartmouth.edu
Message-ID: <6bfi0v$509$1@dartvax.dartmouth.edu>
Source record: 66294

I'm intested in finding out what range of addresses a binary load file must avoid using if it is to be loaded from DOS. I suppose for starters, I could assume that all of DOS and DUP are required, though it's probably only DOS. Ideally, I would like to know for DOS2.0S, DOS2.5, MyDos, and SpartaDos.

In case you are curious, my goal is to incorporate this information as a warning into my binary load file analyzer. Currently it does a good job of validating and even patching up the structure of binary load files. It runs under DOS and Unix, so it's mostly of interest to people using emulators or SIO2PC. You can find it at:
http://www.cs.dartmouth.edu/~crow/atari/

>family of computers...

Actually, the 8086 was the first processor, the 8088 was after that.

The 8086 was a full 16-bit processor, the 8088 was a reduced cost
processor built for the IBM PC/XT, it had a 16-bit internal with an
8-bit external bus.

While they don't have this type of information on this particular page,
they do list the release dates of their processors on:

1238. Atari pages updated!

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-06 00:00:00 UTC
From: Fred Meijer <fmeijer@mailhost.dsv.nl>
Message-ID: <886796301.29741.0.rover.c29fe69a@news.demon.nl>
Source record: 66297

Hi everyone,

I would like to invite all Atarians to pay a visit to my updated atari-pages. You can find news about the atari-8bit, shows, links and pictures.

New is the English and Dutch Abbuc Corner. Abbuc is the largest Atari 8-bit user group of the world. Their own pages are in German, but now I offer their news and information in the English and Dutch languages. Just click on the right flag to get your language!

You can find my atari pages at the following address:

http://www.meijer.demon.nl/atari

If you have any suggestions, news, links please leave a message to me. The address can be found on my pages.

Greetings,
Fred Meijer, The Netherlands

Greeting Atari Users,

Here is an update to our Good Atari Stuff ForSale List.
More items added to list.

ATARI 8-bit items

1.*SOLD*

2. SBM Small Business Management for Atari 8-bit Computers
Original disk, Notebook manual, Basic XL cartridge and manual.
Requires 2 Double Density Disk Drives. Price-$15.00

3. Eleven Atari 8-bit software titles---------PRICE REDUCED*
MRCA Mach 2 / original disk and manual.
Wayout / original disk and manual.
Mad Magazine's Official Spy vs. Spy / original disk and manual.
Asteroid Miners / original disk and manual.
Round About / original disk and manual.
Micro Shuttle / original disk and instruction card.
Bill Budge PinBall Construction Set / original disk and manual.
Raid over Moscow / original disk and manual.
Menu Writer / original disk, manual and box.
Cut and Paste / 2 original disks, manuals and folder box.
Music Construction Set / original disk, manuals and folder box.
All Eleven software items for $30.00.

4. Omnitrend's Universe
2 Original disks and Large Black NoteBook manual
Hard to find game. Price-$30.00

5. Atari Remote Control Wireless JoySticks
Original Box, 2 JoySticks and Interface. No PowerSupply.
Intended for use with a 2600 system but will work on Atari 8bit.
Like new. Price-$10.00

6. Atari XDM121 Daisy Wheel Printer
Good condition. No manual or box. Prints well.
Price-$15.00

7. PQ The Party Quiz Game
4 push button controllers, Interface, 2 original game disks,
4 sets of extra game disks, Original manual and box
Like new. Price-$20.00

8. Animation Station
Drawing Pad and Pen, Original disk and manual.
Like new. Price-$20.00

Atari ST Game Software
---
9. SuperCars II / Original Disk, manual and box.
Price-$7.00

10. RamPart / Original Disk, manual and box.
Price-$7.00

11. StormBall / Original Disk, manual and box.
Price-$7.00

12. Tetra Quest / Original Disk, manual and box.
Price-$7.00

13. Wanderer / Original Disk, manual, 3D glasses, and box.
Price-$7.00

14. MindWheel / Original Disk and Book.
Price-$7.00

15. Essex / Original Disk and Book.
Price-$7.00

16. Total Recall / Original Disks, manual and box.
Price-$7.00

17. Last Ninja 2 / Original Disks, manual and box.
Price-$7.00

18. R.B.I. Two BaseBall / Original Disk, manual and box.
Price-$8.00

19. Jewels of Darkness / Original Disk, manual and box.
Price-$6.00

20. Damocles / Original Disk, manual and box.
Price-$7.00

21. The Sentry / Original Disk, manual and box.
Price-$6.00

22. Q-Ball / Original Disk, manual and folder box.
Price-$7.00

23. Mortville Manor / Original Disks, manual and folder box.
Price-$7.00

24. Into the Eagles Nest / Original Disk, manual and folder box.
Price-$6.00

25. Cloud Kingdoms / Original disk, Poster instructions and box.
Price-$7.00

26. Monster Pack Volume 1 (includes 3 games)
Shadow of the Beast 1.
Infestation.
Nitro.
All original disks, manual covering all games, and box.
Price-$10.00

27. Zork II / Original disk, manual, box, and etc.
Price-$6.00

28.*SOLD*

29.*SOLD*

30. Beyond Zork / Original disk, manual, box, and etc.
Price-$7.00

31. A Mind Forever Voyaging / Original disk, manual, box and etc.
Price-$7.00

32. WishBringer / Original disk, manual, box and etc.
Price-$7.00

33. SpellBreaker / Original disk, manual, box and etc.
Price-$8.00

34. Perry Mason
The Case of the Mandarin Murder / Original disks, manual and box.
Price-$7.00

35. High Roller / Original disks, manual and box.
Price-$7.00

36. Omnitrend's Universe 3 / Original disks, manual and box.
Price-$8.00

Atari ST Applications and Utilities

A1. Easy Draw Package
SuperCharged Easy-Draw version 2.24.
Super Charger version 1.01.
Easy Draw Font Pack 1.
Easy Draw Personal Draw-Art 1.
All Original Disks and Manuals in the Original NoteBook.
Price-$15.00

A2. Partner ST / Original Disks and NoteBook Manual.
Price-$8.00

A3. PayRoll Master / Original Disk and NoteBook Manual.
Price-$7.00

A4. Scholastic Series Biology Package
For Grades 8-9
Volume 1 Original disks, manual, and plastic folder box.
Volume 2 Original disks, manual, and plastic folder box.

Volume 3 Original disks, manual, and plastic folder box.
Volume 4 Original disks, manual, and plastic folder box.
Price-$12.00

A5. Photo Show Plus version 1.01 / Original disks, and manual.
Price-$6.00

A6. Slicctop / Original disks and manual.
Price-$9.00

A7. Michtron Package
The Juggler / Original disk, manual, and box.
Michtron Utilities / Original disk and manual.
M-Cache / Original disk and manual.
Tune Up! / Original disk and manual.
PinBall Factory / Original disk and manual.
Price-$15.00

A8. Metacomo Make / Original disk, manual and box.
Price-$5.00

A9. Quick ST II version 2.21 / Original disk and manual.
Price-$5.00

A10. PaintWorks version 1.5 / Original disk, manual and reference card.
Price-$7.00

A11. AutoProgram database / Original disk, manual and container.
Price-$5.00

A12. HelpMate / Original disk and manual.
Price-$7.00

A13. Abbreviator ST version 1.1 / Original disk and manual.
Price-$5.00

A14. AND Fast-Key Shell / Original disk and manual.
Price-$6.00

A15. AND Cash_Register / Original disk and manual.
Price-$6.00

A16. ZoomRacks / Original disk and manual.
Price-$6.00

A17. Thunder! version 1.31 / Original disk and manual.
Price-$6.00

A18. ColorWriter version 1.2 / Original disk and manual.
Price-$5.00

End of list.

Well, actually I dont have a PC with Bill Gates favorite OS, and noone here does either. :> Bill Gates favorite OS is Windows 98. After all, win98 will include internet explorer and will certainly hurt Netscape even more due to the integrated browser. But I digress. I do miss the days when there were more choices. I like Wintel PC's but that shouldnt be the only thing out there IMHO....Oh well, enough of me biting the hand I feed. (I have webtv - owned by GATES of course)

For Dos 2.0s its about $1D00 as the earliest.
MyDos is higher, around $2000
2.5 should be similar
Dont know for sparta (No DUP there)

For that matter, it would be nice to have the actual dos routine
relocated to page six so that you can load those long ass files from
menus. Right now the kludge that is in files like Davids midnite
magic and ghostbusters and zombies, will only work from dos. for some
reason all the menus including menu.atr wont pick up the init at $2e2
in time, but dos does. Weird. Anyone have any idea why? It operates
the same on emulators as on a real atari..... this is something that
has driven me batty for over 15 years.....

That wouldn't work, as some files assume that they can load page six.
What would be ideal is a loader that is fully relocatable to any page.
It would simply relocate itself if it was about to overwrite itself.

>Right now the kludge that is in files like Davids midnite
>magic and ghostbusters and zombies, will only work from dos. for some
>reason all the menus including menu.atr wont pick up the init at $2e2
>in time, but dos does. Weird. Anyone have any idea why? It operates

>has driven me batty for over 15 years.....

The problem is that most menu programs are confused as to how the init
field is supposed to work. They just load the entire thing, then do
the init, then do the run. They are supposed to do the init between
each block if a new one is specified. The simple way of doing this is
to use the following load algorithm:
Initialize the run address to the run address of the current
program (e.g., DUP or the menu)
(*) Initialize the init address to the address of a RET
instruction
load a block
JSR indirect through the init address
If there's another block, go back up to (*).
JMP indirect through the run address

The other thing that a load program must watch for is that while the
first block must have a $FFFF before it, some other blocks may also
have that, even though technically they shouldn't. I've also seen a
lot of files with garbage at the end of the last sector, probably from
XMODEM downloads that wrote the entire last block, even if there
wasn't that much data.

I've seen a few files that assumed that they were loading on top of
zeroed-out memory. Anytime they have a block of more than 4 zero
bytes, they split the block into two blocks to save space in the file.
This probably works with DOS, which will buffer and copy the data if
the entire sector isn't being read, but not with menu loaders that
will read the sector in place and copy from there. I expect that the
programs would still run, but they would look funny as it would be
graphics data that would be compressed in that manner.

I believe the dostop for Mydos and its menu are both defined in the source.

I thought I converted those for you to regular binary load files? I think
they originally only worked on SD DOS 2.0 disks because the loader
was coded to get the next sector number at +125 bytes.

If there is still a problem with them, send them over and I will run them
through the ApeLoader. It has no problem with multiple inits, so if
there is another problem, I should see it.

Howdy!

I would like to buy a second atari 800 XL with good condition, may include
additional hardware.

call 0177/2963770 (not before 16:00)... or write to my by e-mail!

please only german atarians, or without shipping costs from elsewhere.

Source record: 66315

I have found through my own programming tirals and troubles, that a ML Loader placed in Page 4, the cassette load buffer will load 99.99% of all programs without a problem.

The problem with a relocateable loader code is that it must first read through the entire program to determine the load addresses, prior to beginning the load. If the code being loaded uses an init address, or possibly more than 1 init address, then you have to almost disassemble that code in your loader program, to insure that it isn't filling your address space.

To date the cassette buffer seems to be the most effective and efficient.

The Shadow

Source record: 66234

Hi to all UK-based Atarians!

Stupid question but: anyone interested in accessing an exclusively Atari 8-bit bulletin board?

Proposed set-up: 20Mb SCSI, 1Mb 130XE (plus possibly APE running half a dozen 16Mb 'hard drives'), all speeds and a dedicated telephone line running 24 hours a day, seven days a week. Plenty of software to download and lots of SIGs.

Anyone interested? The kit is available for switching on now, but there's not much point until there's a possibility of callers!

Email me or post a reply here (email is more likely to hit target)

Best wishes

Jerry

I gave my ATARI 800 and lots of commerical software to my brother's friend
and my brother's friend vanished away. I had ATARI 800 then ATARI ST then I
am forced to switched to IBM PC in 1994 because of PC popularity.

In 1997, formally ATARI 800 and ST market are DEAD!

I am finally got ATARI 800 emulator (PC Xformer V3.6) and it is working but
I do not have any commerical software.

I like to find commerical software for ATARI 800 below:

BASIC A+
ATARI Macro Assembler
Shamus
Shamus II
Ghost game (maze game that the ghost go along)
Crypt (I guess)
Questron I

Also I have to know where I can get ATARI 800/XL memory map documents. I
need them to access lots of hidden addresses that are useful for the game
developer.

Are ATARI 800 commerical softwares on the Net?
If yes, they must be ending with .ATR or .XFD files so my emulator can read
these files. They may be patched by the crackers to disable copy protection
that did not work on IBM PC, I guess.

Sadly, Atari never sold their 8bit lines officially in Japan. There were some "gray" imports which attracted some dedicated fanatics (like me :), but that was about all.

As you may know, Atari DID a serious effort in Japan once (in '83 IIRC). They even ran some TV ads. I was pretty much excited about the news, and equally disappointed to hear that it was to be by a repackaged VCS (called 2800). To add to the injury, it came with horrendous joystick/paddle rolled into one, which even grownups had trouble handling, forget about kids. Well, that's Atari for you :/.

-> load a block
-> JSR indirect through the init address
-> If there's another block, go back up to (*).
-> JMP indirect through the run address
->
That might work. However, the routines I am talking about do this:

They load into $400 or $480 depending on what they have to load.
They initi at $400 (or $480). They load the next sector per the
sector chain into $480 (or where ever you need to start) The loader
routine fits in $7D bytes (in fact, a little less than that. The

loader routine AND the six bytes for init AND 00 00 padded to the end
of the first sector) Then, it loads the next sector in the line,
which does not have a $FF $FF at the beginning of it because it is a
raw sector dump, incrememnts the load buffer by $7D, then reads the
next sector per the sector link, until it gets to the end and then it
JMPs to a hardcoded address.

I would assume that modifying the menu program in question (Jellystone
loader....which I just hacked from someone elses' which anyone can
tell if you see the spagetti code in it!) I guess you would after
every sector read you JSR ($2E2) and if it's set to RET all fine and
dandy, but if it isnt it will execute loader??? Is this what Dos
does???

You can do all that with the "Util" program, which can be down-
loaded from the UMich archive or other places. Or you could call
the BBS of the former Atari club in Louisville (1-502-456-4292)
and download it from their files section.

->problem.

Well, they don't *both* work at the same time, but they *can*
both be "on" at the same time. One possible cause for your prob-
lem is that you've got the dipswitches set wrong, so you need to
recheck the manuals and the dipswitches (or toggle-like switch on
the 1050) to make sure you have one set as drive #1 and the other
as drive #2.

Another possible cause is that whatever DOS program you're
using hasn't been configured for two drives. Using BASIC, PEEK
at location 1802. If it returns a value of 1, your copy of
whatever DOS you're using is configured to see only one disk
drive. If that value is changed to a 3, your system would under-
stand that there are two drives. Make a backup copy of your DOS
master disk so you won't mess up your original, and try the fol-
lowing procedure on the backup copy:

Using BASIC, type "POKE 1802,3" and hit <RETURN>. Now you need
to save (write) the revised version of the DOS you're using. With
some smarter DOS programs you would now hit <SYSTEM RESET> and type
"DOS" to get to menu or command mode and then use the proper com-
mand for writing a new DOS.SYS file. Based on a quick glance at
the Atari Company DOS manual (for the "standard" 2.0), I think you
might simply type "DOS" now in order to get to menu mode. After
your revised DOS.SYS file has been written to disk, turn the compu-
ter off and test what you've done by booting up with the new ver-
sion. If your DOS program now works with both drives, write-protect
the disk and use it as your new master copy. (This is a boiled-down
version, of course. For more details, see your manuals.)

->BTW what should the SD/DD(single/double) dip switch be on for
->the indus

Are you asking what it's for ON the Indus? Or what setting it
should be set on FOR an Indus? I'll answer both possibilities:

You're apparently referring to the second dipswitch from the
right. SD is single density (128 bytes per sector); DD is
double density (256 bytes per sector). In order to make use of the
Indus's DD capability, you need to use a double density-compatible

version of whatever DOS program you're using. There are double density versions of such programs as OSS-DOS-XL, MyDos, Smart DOS, Sparta, and so on. The double density version of Atari Company DOS was 2.0D (note the "D"). These programs have options for switching density modes; the smarter ones can automatically sense what the density is of a drive or a disk in a drive when you boot up or hit <RESET>; the smartest ones will sense the proper density mode whenever you access a drive. (Incidentally, as I've noted in past years on this base, Atari DOS 2.0D *does* exist. I have it!)

As for whether to set the Indus dipswitch on SD or DD, it's a matter of personal preference. The setting only affects which density the drive is in when you boot up. (Assuming the drive is empty, such as for a drive configured as #2. If you have a disk of the other density in the drive at bootup, that would override the dipswitch setting.) You can set it whichever way is most convenient for the way you use your system.

1272. POKEY chip.

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-08 00:00:00 UTC
From: Scott Weiland <saw151@psu.edu>
Message-ID: <01bd3495$7a6edfe0$a3d27680@saw151.rh.psu.edu>
Source record: 66324

Hello all,

I had a quick question about the Pokey chip. I want to use this chip with a robot I am currently building to add some sound and a few potentiometers. The chip I am trying to interface with it is a motorloa 68hc11a (8-bit microcontroller) that runs a 2Mhz bus clock. I am wondering if the Pokey chip will work with it, seeing that it only runs on a 1.79 Mhz clock. Is there a way I can do this?

Thanks,

Scott

Do you have another 1050? If not see if you can borrow one, connect the second 1050 to your 1050 as drive 2, if it works then you now know the problem is in the indus, if it doesn't then the problem is in your 1050.

If it is your 1050 replace the CA3086, or LM3086 chip at the back of the drive, be carefull removing it as you can lift traces as it is in an awkward are to work. This should eliminate your problem, if it is in the Indus, (doubt it), then post again and will look up the part to change.

It is not a dumb question. As far as I know it can't be done or at
least
I have never tried to connect both units to the same comuter but at this
time I would say not it can't be done, but look at what Atari said
couldn't be done. Interesting thought though 2 units on the PBI may
have to attempt something like that one of these days.

At the presant time you would need an 850, PR:C or something else to
supply the RS-232 port the KPI does have a printer interface built in
but not a RS-232. I have some stuff that I am getting ready to send to a
hacker that may improve the unit but will wait see what I am told after
receiveing the data and hardware I send. I had someone design a RS-232
port for the KPI several years ago but never completed the project. The
designer dissapeared have not heard from him since beleive he went IBM.

I think it is currently impossible to get those to work on the
emulators due to the fact that there is a problem with the way they
use the keyboard input. The emulators seem to fall down there. Those
keys in those programs only seem to work on a real Atari at the
moment.

1276. Looking for old games

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-08 00:00:00 UTC
From: BurlingamesNOS@PAMworldnet.att.net
Message-ID: <6bl254$ekt@bgtnsc02.worldnet.att.net>
Source record: 66328

Hi all --

I've been trying to get back into my old Atari 800 stuff, and I've gotten a couple emulators to work, downloaded some old games, and I've been having a good time. My thanks to all who have put time into making this so accessible.

My Atari 800 is dead (left it at home while I was off at school, and my Mom's cats urinated on/in it.) A friend who still has a working 800XL is in possession of my disks, and I'm trying to get him to transfer some old personal files onto his PC and send them to me.

In the meantime, I'd like to get copies of the following games, which I actually own, but have no way to access:

Seven Cities of Gold
Bandits
Mail Order Monsters

Are these still in existence? Has anyone successfully emulated them? The original 7 Cities is 10 times better than the PC (personal computer and politically correct) version that came out a couple years ago.

Thanks,
Rusty

Just a question, but why make a video of such references instead of a
CD-ROM? I recently obtained the "Digital Press CD", about classic
videogames, and it has AVIs and MOV files of commercials, scans of
boxes, ads, transcripts of manuals, reviews, etc.

So, for archival reasons, it seems a CD is a better way to go.

Just my opinion.

>very interested in the game, I lost interest.

What a blast of nostalgia I got running into this message. I didn't work on Universe, but I worked on every Omnitrend game from Paladin onward, including Universe III.

FYI during the development of Rules of Engagement 2, Omnitrend President Thomas Carbone and I had some serious discussions about doing a 10th anniversary update of Universe for 1994. The plan would have been to keep the same game story and locales, but tighten it up and use the CCSI2 interface system used in Rules 2. We even discussed shipping the game in a black octagonal box that looked like the Hyperspace Booster that you are searching for in the game.

Sadly, after Impressions totally botched the marketing of Rules 2, and Mindcraft failed to pay all the royalties due on Rules 1, Omnitrend got out of gaming, and, thus, the updated Universe got canned.

I have a working rom of MOM, but the only problem is you can't do tournament play because it wants to save your monster's stats to a disk, and I don't think there is an emulator out their that will write a rom file. You can play it in beginner and intermediate mode though, any way if you would like a copy email me and I'll send you it. It's two roms so you have to "virtually" flip disk when it ask, but that's not to difficult.

From: starsabre@oui.com
Message-ID: <1636958174.28745039@oui.com>
Source record: 66241

Let me preface this by saying that I proudly own an MS free Mac, and am generally uninterested in MS products. With that in mind, there is a thrift near me that has/had a copy of MS Basic for the Atari 8-bits. I didn't get it at the time, and I am wondering if there is anything out there for which it would be beneficial to have MS Basic, and if so, what it is?

I would appreciate any replies be echoed to my mailbox. I will watch here, but my host doesn't hold messages long enough for me to be assured I will see all replies that come through.

Thanks,

I've been wanting to play this game since I first heard about it WAY back when I read a (not very flattering) review of it in The Space Gamer. I found the disk images in the Hackerz archive but, with no docs, I'm a little in the dark. I find the radio signals but the computer won't let me land.

So, after several unsuccessful attempts to locate a full version, I find a company selling something called "Quest of the Space Beagle". Is this the same game (since the ship in JM1999 is called the Space Beagle) or is this some Peanuts comic-strip take off with Snoopy goofing off in outer space?

Thanks!

I wasn't reading any newsgroups for more than a year and
i am now not really updated on what is going on in Atari 8bit
community.

The questions are the same:

1) Did ATARI finally released all of its ATARI 8bit games
into public domain ?

2) Is there a good ftp archive of atari 8bit (ex-) commecrial
games ?

3) Which is the best atari emulator for MS-DOS / Win95?

Thanks

Hello James... I would most definately use the Internet route. Saves
the LD and multitasking on the PC while I use ftp is preferable to to
the one task downloading that a pure BBS solution offers. On the
other hand, a telnetable BBS setup would be the coolest; best of both
worlds.

No, QOSB was actually a sequel to JM 1999.. only probably with these 4
disk games are, they took forever to load, and unfortunately the
programmers did NOT design them to run with 4 drives. (which would save
hours of disk swapping).. I enjoyed space adventure and RPGs in general.
They were just too slow on the 8bit, or lacked in sound and grafx.

Spurred on in part by this posting I actually did manage to crawl out
from under my rock in time to catch the end of yesterdays sale. By the
time I got there (12ish) people were packing up, but I did see a fairly
pristine looking 800XL for sale with a cassette deck. Didn't check the
price though.

Quite a lot of old computers there, actually. I saw an old Spectrum +3,
an Amstrad 6128, loads of MasterSystems and MegaDrives, an Atari Lynx
and squillions of old 286's. No Macintosh G3's going cheap though :(

All in all, worth a look.

1293. XL power supply

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-09 00:00:00 UTC
From: "Thomas J. Andrews" <tandrews16@delphi.com>
Message-ID: <xDeHdJz.tandrews16@delphi.com>
Source record: 66252

I spotted an XL power supply the other day at a Salvation Army store. No computer, just a supply. It was bigger than any other I've ever seen, although it carries the familiar part number of the more common one. Looks like it uses the same case as the supply for the original 520ST. It actually has COOLING VENTS!

I wonder if it might have a bit more capacity than the regular supply, although it doesn't say so on the case. My 800XL blew out 2 supplies since putting a 256 Rambo upgrade in it before I switched to an XE, and I've always thought the extra load from the Rambo was just too much, as if the XL normally taxed the supply's limits.

I bought it for $3.99, and it worked when I got it home. Whaddya think, did I get a good deal, or did I get taken?

TJ

The question remains, for me, how to create a blank megaimage. My old
800 is no longer functional, so I need to do this completely with
emulators. Any hints?

>DD = 720, but it's holding twice as much in each sector
>

Well, you're close. The first numbers you give are the total number of sectors on the disk. Not all those sectors are "free." Several are used for housekeeping duties, for the directory and the map of used and unused sectors. Most DOSs will give you a free sector count of 707 free sectors in SD and DD, while MyDOS will give you 708. This is because DOS 2.0 formatted disks with sectors numbered from 0-719, then tried to access them as if they were numbered 1-720. Consequently, DOS 2.0 couldn't access sector 0. Several programs were written to use that sector for things like a disk label, etc. Most other DOS's kept the same "bug" for the sake of compatibility, but MyDOS "fixed" it on their disks by numbering sectors from 1-720.

DOS 2.5 ED disks do have 1040 sectors, but only 1024 are "free." The directory request does list "999+ FREE SECTORS." MyDOS ED disks are not compatible with DOS 2.5. While MyDOS can read a DOS 2.5 formatted ED disk in its entirety, it can only write to the first 708 sectors.

I used to use DOS 2.5 almost exclusively, back when my second drive was a stock 1050, and I wanted all disks to be compatible in case drive #1, an XF551, failed. Now that all my drives are capable of double density (an Indus, 2 XF551s, US Doubled 1050), I use MyDOS for practically everything.

I was doing that for a couple months, altering my address to
otter@oz.SpammersWillBeKilled&Eaten.net; until I received a message
from my sysadmin requesting that I not do that anymore. It seems that
all bounced messages were being dumped into their email box.
Unfortunately, I have not yet found a way to set up a filter with my
mail reader (using Minuet since a 486-33 is too intolerably slow for
Netscrap...)

I've been considering having my Cleveland Freenet address as the
reply-to address for my messages I post now. Then, I may be able to
set up a killfile there to filter email and then have the legit stuff
forwarded here to my primary account...

It's amazing how little thought some programmers put into how their software accessed disk drives.I was shocked when Print Shop would only use drive 1. Unlike the IBM,it's easy to see how many drives are attached to the system. (just poll them using the GET STATUS SIO command,always going through SIOV, of course.

One solution would be to re-programme a Happy drive to make double density disks look like single density ones.The first 360 256-byte sectors would look like 720 128-byte sectors.If you accessed the drive with it's drive code+1 then you'd get the second 360 256-byte sectors.This could also be extended to DSDD256 disks to put four single density disks on one floppy.

This solution could also be implemented at a OS level via a RAM OS. (except for 64k games,of course.If only Atari had stuck with the 800 design games could've used the Axlon upgrade)

>then guess what and where a file is located. It also has trouble

The run-time will automaticly run a file called AUTORUN.CTB.
(or something like that)
Well it's really like how ML programmes on Linux and Amiga aren't "stand alone".It's probably better that way.You can fix bugs by replacing the run-time.Also the run-time could be stored in ROM or bank-switched RAM to make more room for the CTB programme.For example:it could be activated by a vector like SIOV,the warm/cold-start vectors and blackboard mode.Then it would read in the file via channel #1 (or whatever).You could have a DUP that could JSR to certain addresses whenever it sees a certain extention.(or header)
This could also be used to to auto-run BASIC programmes.
It would be up to the user to load up the routines needed to give control over to the CTB & BAS run-times,rather than bloating DUP.

>with Sparta DOS. The version patched for Sparta DOS doesn't come
>with a compiler.

You could use SpartaDOS 1 or 4.

>BASIC XE provides a way of speeding things up too, although it's
>not a compile. Just some fancy tricks with memorizing what address
>each subroutine is at.

Not that fancy.It could be done in AtariBASIC with a function to return the ML address of a line number.(like ADR() with variables)
And a way to specify a ML address rather than a line# to GOTO.
Also BASIC XE won't work with SpartaDOS 2 or 4.
(unless you load 4 into bank-switched or non-OS shadow RAM)
SpartaDOS 3 was made to avoid the parts of the OS shadow RAM that BASIC XE uses.

>operating systems and I want to replace the Operating system with
>the Atari800 one.
>As well Where the microchip containing Basic is located.

If you were to somehow add BASIC you wouldn't be able to use it with the 800
OS since it's up to the OS to switch it in when it sees OPTION pressed.
(you could do it manually via ML.There are some programmes up on umich)
And you lose the LEDs,I think.Also programmes that look for joystick ports 3 &
4 via the OS database would see garbage.
(the XL/XE OS just shows ports 1 & 2 in place of 3 & 4)

From what I've read,there's really nothing wrong with the 1200XL OS.
(which some call Rev.C.IS it really called that by Atari?)
It's just that many games violate the OS.IT wouldn't be so bad if they just
directly accessed the hardware (except for joystick ports 3 & 4,of course) but
some access the OS's internal routines and variables and malfunction when you
use a different "compatible" OS.Just look at the IBM.People do all sorts of
horendous things to MS-DOS all the time.I saw someone ask about how to
determine free memory and someone replied about actually walking the MCB chain
it-self.(MCB=memory control block)
And I don't want to talk about the terrible situation with RS232 port access.

If you look in some ML programming books for 6502 and Atari you'll see advice
about how to access E: character-print routines directly.Of course the right
way to do single-byte PUT/GETs (like Apple and Commodore) is to define a
zero-length buffer and use the acumalator as a buffer.

(those "->" messed up the re-posting)
Why not just use a Atari emulator on the IBM?
Or just use a SIO2PC cable.Then all you need is the Atari computer it-self.

Ah,I just love watching super-powered modern computers struggle vainly to
emulate a 1979 computer.I shudder to think what would be needed to emulate a
Amiga.(The Amiga is the sequel to the Atari;made by some of the same guys)

You know that there's a cable called SIO2PC that allows you to use your PC as a
disk drive for the Atari.With the APE software you also get a poor-man's file
server called "PC Mirror" as well as disk emulation.You see the files as being
on a DOS 2 disk.But you can't POINT through a file on a PC-Mirror disk,just a
normal SIO2PC disk.Also you can't write to the PC-Mirror "disk",just read.
(but you can write with the comercial version;but still not POINT)

Both SIO2PC and APE software (both relying on the SIO2PC cable) allow you to
use ATR disk images.APE also gives you speed a bit faster than a Happy drive.
(Happy does go at 53200 baud like the US Doubler?)
But the APE docs are rather confusing.(luckily I'm a Atari guru)
And it's still painfuly slow compared to the slowest Atari hard drive.
In fact most modern floppy drives are much faster.

>there a simple way to transfer them onto Atari floppies that can be
>read on the 1050? I noticed that A.P.E. can do this, but this
>program seems a bit more elaborate than what I need.

You can do this with the IBM's own floppy drive.(check the FAQ for software)
But you can only use the first side of the disk.
(You can only put the disk in one way on IBM drives.That's why they invented
double-head drives)

>2) What's the best way to connect to the web using my 8-bit? I
>have a University account. Maybe instead of transferring files,
>could I just download them again right onto the 1050?

Just use FlickerTerm-80 (faster) or IceT (better looking) to FTP the files and
then use A-Tar-Zee to download them via Z-modem.(it has a built-in term)
Try to see if the University has NCFTP instead.It's better than "ftp".
BobTerm can be used to Y-Modem.But NEVER (!!!) use X-modem to download COM
(OBJ) files.OR anything for that matter.It's SLOW and adds garbage to the end
of files.This didn't matter with CP/M (where X-modem came from) since CP/M
(which has it's own DOS built in)
doesn't keep track of how long files are so that programmes must keep track of
it themselves.Since Atari's DOS keeps track of the exact length of a file
programmes just rely on DOS to tell it that there's no more data left in a file.
(There's no way for a programme to tell how long a file is but to read through
it to the end)
So programmes don't know to just ignore the extra bytes at the end of X-modemed
files.In the case of OBJ/COM files,this is fatal!

So just use Y-modem and Z-modem.(and Kermit)

It's impossible with real SIO devices since there are only 2 auxilary numbers
in a command frame (packet).It'd probably be better to stick with 16MB
partitions.But a "map partition to unit#" would be nice.
(that is,maping a partition to drive#4 rather than a specific SIO device code
since this would break drives like the ATA ("IDE") interfaces which treat the
device code and unit number in the DCB differently than the SIO handler
(it doesn't just add them together))

Not to put too fine a point on it but Imageman-made dual density 1040
sector ("ED") disks are incompatible with MyDOS.As are any dual density disks
made with DOS 2.5.You'll have to re-format (i.e.re-build the file system) them
under MyDOS to be able to WRITE to them.Reading should be no problem.
Also Imageman doesn't use the last sector of a 720 sector ("SD") disk.
But neither dos DOS 2 or 2.5.You can use VTOCFIX to free it up for use if
you're going to add files to the disk via MyDOS.That is,if you really miss that
extra 125 bytes.

Why did you make the sectors 128 bytes.256 bytes would make it faster.
(but not much since APE gets rid of somne (most?) of the inter-sector pause)

Why not just store them as individual files and use a batch file
(hopefuly with 4DOS/NDOS)
to start the emulator.The batch file could use special options automaticly for
programmes that need XL (rather than 48k 800) emulation and so forth.
The easiest way would be to boot the images via the C: device.
(like when you hold down START to boot a tape)
But do C: boot files (as opossed to loading from C: using DUP) work the same as
D: memory (COM) files?

It has nothing to do with OSes.It's just the way the emulator works.
The BIOS totally ignores the scroll-lock key.It doesn't even pause screen
output.MS-DOS's CON device just translates device-driver calls to BIOS ones.
(why do they call it the "CON:" device?)
On the other hand the Atari DOES pay attention to control-1.
Which is funny since F1 pauses output on my "digital" VT320 terminal.

Look into ANSIPLUS to solve this little "bug".

It's not like the IBM.The differences between disk drives just involves sector size and number of sectors.MyDOS can use 65535 sectors at both 128-byte and 256-byte size so it can use everything.And the OS imposes no restrictions on sector size.But it limits you to 65535 sectors.
(at least for SIO devices)

>So here's question #3: Wasn't there an MS-DOS emulator for the Atari

There was a CP/M add-on.But I think that it used the Z80 chip (8-bit) rather than a 8088 chip (16-bit) so that would be useless.

It is only a VERY limited sub-set of Microsoft BASIC.Utterly useless,actually.
No PLAY or DRAW commands.And you'll have to translate the SCREEN command to the
Atari's GRAPHICS command.Even the TRS-80 COLOUR COMPUTER had a better version!
So forget about running programmes from other computers.You might as well
re-write them for AtariBASIC yourself.
(I think it gives you integers,though)

And it doesn't come with any type of converter.

Not really.Besides the DIR and RENAME command being the same,they're actually
totally different.It's like saying that ProDOS is a primer for UNIX because
they both use "/".
(MS-DOS does too,for that matter.But it confuses some programmes)
I've never understood why people call them similar.Nor why you would want to
make the Atari like the IBM.SpartaDOS lets you run a programme over-and-over
again without re-loading.(via RUN)
What I hated about MS-DOS was that you had to re-load a programme over again
for each operation you did.For instance to create several ARC files.
You had to have a RAM-disk to get anything done!
Why people try to emulate that on the Atari I have no idea.

>tried to format it, it gave me Error 132.

I'm afraid density is rather meaningless information on the Atari except for formatting.But you're just re-building file systems so it's totaly meaningless for you.You just need to know the number of sectors and how big they are.
Remember that all DOSes (except DOS 2.5???) read the needed information from a special sector on the disk and via the GET STATUS SIO command.
(GET STATUS just tells you the size of the sector,and whether it's a 1050 disk)

Unless MyDOS reads the drive configuration it-self,there's no way to tell it to make a file system (or format) with 128-byte sectors
(which can be either single or double density,hence my earlier paragraph)
and make it have more than 720 (1040 when formatting) sectors.You'll have to use a disk image with 256-bytes per sector.

Also APE returns bogus information as pertains to the highest head number.
(i.e.all single sided drives look like double sided;double looks like triple)
So programmes that ask the disk drive for the information with think that disks are twice as big as they really are.This should only affect formaters that write out a file system
(like SDX's FORMAT,but not DUP,it would seem)
and file system re-builders/fixers.
(like MyDOS's VTOCFIX,but not DOS 2.5's DISKFIX)
Diskcomm formats a disk but doesn't write a file system so that should be OK.

I'm not sure how this affects emulators.(does the ATR header store head# info)

>The correct command sequence for config and format of a large HD
>image mounted in drive 1 is:
>O
>1 (drive #)
>N
>Y
>Y
>16342 (total sectors)
>I
>1

You should type "1/N" rather than "1".It's faster since you bypass the format and go straight to writing out a file system to disk.

(MS-DOS's FORMAT does this automaticly if the disk is un-formatted or it can't
tell the format from the boot sector.IBM drive controllers don't give this
type of information like Atari ones do)

>Y
>Works for me, 16342 sectors, 32684 sectors, etc.

Why such odd numbers?

Anyway that won't work with his disk images.Notice how MyDOS (rather naively)
doesn't ask you about the sector size.That because it assumes 256 when told
that it's a "high capacity" (i.e.larger than 720/1040) drive/disk.
It's really no problem.MYDOS will still WORK with large 128-byte sector images,
you'll just have to use a seperate programme to format the disk
(not necasary with disk images) and build the file system.

I realize that this is somewhat technical,so feel free to ask questions.

Since most programmes bypass MS-DOS,even when they don't have to,
(c.f.MS-DOS's HELP,EDIT and MSD)
it probably wouldn't be of much use.Even if it included a BIOS.

Does the ATR-8000 really have a 8088?
I'd assume it'd be made to use normal CP/M rather than CP/M-86.
(i.e.a 8088 wouldn't be able to run old (read "most") CP/M software)
But then again I don't know when the ATR-8000 came out.

I just love all the chess analogues!

I,for one,would've like to have not seen so much of the 800 architecture left behind.So much for those memory,BASIC and 80-column upgrades.As well as Corvus hard disk drives and four-player games.(we had it before the Nintendo Ultra64!) Also the 1090XL would've been nice.

That's not that fast,considering that the slowest UltraSpeed drive goes at
53200. (and not 38400 as the APE manual says)

While it might seem like a great idea to connect VGA cards and "IDE"
cards,remember that these are SLOW devices.Many of the older ATA "IDE"
interfaces just connected the IDE drive to the CPU (and DMA) chip.Rather like a
850.And using a VGA display would involve moving around so much data that it
would be useless for games.
(unless you only animated one or two planes at a time)
The IBM video cards don't have things like P/M graphics and sprites.
Still it would be great for 80-column displays and showing GIF and RGB files.
And the video controller's "co-processor" capabilities would make it faster
than simple planar graphics.
(you can write to more than one plane at a time with a single write,and the
video-controller can do various modifications to the written byte
(XOR and such))
And you could use fast modems.Of course the ROMs on the boards would be useless
so you'd probably want to have RAM on the PBI-to-ISA interface to hold device
handlers that would be run by the 6502 so they wouldn't eat up all the RAM in
the Atari.The ISA handlers would swap in like BlackBox and MIO ones do.

Why "EXE"?
It's COM for SpartaDOS and DOS XL and none for MYDOS/AtariDOS.Is that for some
new DOS?

I don't know about RainBow but how would you boot a COM/OBJ file without DOS?
(via a tape boot?)
He probably just needs a way to put a file into a ATR image.
(it's funny how people don't read the manual)

OF course there's also the fact that (some?) XE game systems didn't come with a keyboard (mine did).Of course Atari game programmers never dreamed that Atari would decide that the keyboard was a "extra" so games are not really made to avoid keyboard use.So if a game seems un-playable it's probably from lack of a keyboard.

What the hell were they thinking?!?

>Ataris with Keyboards at anytime in my life. ;-)

My favourite has always been the Atari.I used the Apple (at school) originaly
but got converted to Atari when I got a 800XL.I really prefer the Atari to the
IBM.With the IBM you get all sorts of vague,meaningless error messages.
With Net-Tamer,you can save a message to a directory file ("C:\DOS") and it
won't even GIVE a error message.Most programmes just tell you that there was a
error without telling you what it was.Even in Linux.I tried to read a GIF on a
CD that stopped working with SPIC and it told me that the file was empty!
(rather than "I/O Error")
Lynx is worst of all.

Anyway,here's the list.
Apple 2E
Enhanced Apple 2E
Atari 800
Atari 1200XL
Atari 800XL
Atari XE Game System (broken power switch)
Vic-20
Commodore 64
Commodore SX-64 (portable 64,if you consider a tower PC portable!)

Commodore 128
IBM clone (80486DX-33,16MB)
Laser XTE (has EGA but too slow to use it)
Amiga 500 (512k of slow (non-video) RAM added to 512k of video RAM)
1040 ST with Supra HD
Texas Instruments 99/4A. (with disk drive but no DUP/CP cart!!!)

>Add to that list nearly every game system I could lay my hands on,
>and it's pretty sad! I've had the Fairchild, Atari, Intellivision,
>ColecoVision, Atari 5200, Nintendo, Sega Master System, Genesis,
>Snes, Jaguar, 3DO, Oddessy, GameBoy, Game Gear, Turbo Graphix 16,
>and more! Even sadder, I still have most of these!

Do you mean the original Oddessy?
The original just took their weird circuit boards and was really just
variations on Pong.The one that had the membrane keyboard and real cartridges
(with handles!) was the Oddesssy 2 (2 as in "squared").

It's amazing that people don't use these things as home computers.They're so
powerful.I wonder what I could do with a Sega Saturn and BASIC.
(if only I could read Japanese)
Even the MegaDrive
(which is called a "Genesis" in the U.S. for some strange reason)
is really powerful.And the MegaCD adds a lot of memory plus a way to run
programmes.(using RAM carts for data storage)
But the Saturn is just too much.640x200 (with optional interlace and over-scan)
plus speed,more memory than you'd ever need and optional hard disk drive and
printer and BASIC and MODEM and PS/2 keyboard.Why Sega isn't putting out BASIC
and a assembler in other countries is beyond me.With the Netlink MODEM you
could download shareware that individual programmers had written.
Just imagine Rogue-type games on it.(like Nethack)
And also why games don't take advantage of the PS/2 keyboard.Like RPGs!

Well,here's the list. (all U.S. versions)

Atari VCS (model CX2600)
Atari (CX?)7800 PRosystem
(no power adaptor;does anyone have info on the adaptor's specs?)
Oddessy 2
Bally Astrocade
Intellivision 1 and 2
ColecoVision (bought a bunch of games but can't find the damn power adaptor!)
Sega Master System (old style with card slot)
Sega Mega Drive (aka "Genesis") with MegaCD ("SegaCD") and 32X.
(new-style MegaDrive and MegaCD;no powered CD drawer)
Sega "Nomad" (portable MegaDrive,but no 32X support nor MegaCD port)
Sega Saturn (original,as far as I can tell;can't use carts) with Netlink

(do the Saturn and the Nomad have "real" non-US names?)

Sony PlayStation (aka "PSX")
Normal,Super and ULTRA Nintendo Famicoms/Entertainment Systems

Nintendo GameBoy (original)
Goldstar 3DO (no save-game manager software)
(which I like because it's not just for games;they actually used all that computing power for something useful)

Still looking for Atari Lynx,Sega Game Gear and Jaguar stuff.

A moot point since the BB only has one RS232 port.You might be able to use that
and a 850 at the same time.

>It works, but is a bear to deal with.

Well the "interface speed" is set by BobTerm.The MODEM uses the "AT" at the beginning of a command to tell what speed you're at.Also some buffered modems will talk to BobTerm while in command mode but then they dummy up when they goto data mode (i.e.you connect).It's because BobTerm (and many others) don't set the RS232 control lines corectly.Just run Kermit-65,goto terminal mode via "CONNECT",and then exit via OPTION-C and "QUIT" and the control lines will be set-up corectly.It's stunning that Bob Puff would forget to set the RTS line.

And my MODEM (a US Robotics Sporster X2) always connects at a speed EQUAL OR BELOW the actual baud rate (of the RS232 port).Otherwise it wouldn't make sense.Does your MODEM have a connect rate of 19200?

>about it isn't it?
>Oh yeah, what order should the units be turned on in? Ive been
>doing modem,850, drives,computer.

IT doesn't matter as long as they're all on in the end.
(the 850 has to be on while BobTerm is initializing to load the handler)

Remember that you must run Kermit-65 before you run BobTerm to un-lock buffered
modems because BobTerm doesn't set the RS232 lines corectly.You actually have
to use the CONNECT command to get Kermit to set the control lines.

That also happened to me with my 2400bps compression modem.I'd have to type a
command (at 9600baud,anyway) over and over again to get it to work.
But not with my old Sporster 14400bps.

>Please feel free to update/correct/spank me.

Does the MIO at least let you control the RTS and CTS lines like the 850?
IF so you could write your own handler or else implement flow control in a term programme.(I'd prefer the former)

But unless the Atari can't actually keep up with 19200 you don't really need it unless you're uploading using a modem that doesn't even have 1k of buffer.
(and remember that the slowest disk drive runs at 19200)
It's more a matter of the term programme keeping up.And that's solved by the term specifying a buffer big enough that it doesn't matter if it can't keep up.
e.g. Y-modem need only specify a 1k buffer,F-modem 4k.
Term programmes need to have enough of a buffer to hold a page of information.
(plus VT100 codes if using 80-columns)
Of course the P:R:Connection doesn't let you specify a user-defined buffer.

I think that it's supossed to do that.The 1030 does that too.
(plus it uploads a term programme)
Try actually USING the R: device and see if it's actually loaded.
It probably acts like a disk drive booting so that it can upload the boot-loader
to the Atari.Then the boot-loader loads (and re-locates) the actual handler.

>and/or to boot some mysterious parallel port software (which was
>AFAIK never available either).

The parallel port handler is built into the OS ROM.You don't need to load a
handler.(or did you mean the P2: handler mention in the Atari OS manual?)

>you.

Why does everyone want to make "Mapping" into some format that I've never even heard of?
But I can't read PDF or "Word".Can't it just be text + GIFs?
(were there pictures in the book???)
Atarians can use the text (40-columns,who would actually print it all out?) and the GIFs (1-bit,the whole book is just black&white,using JVIEW).
And Atarians can upload the text to their ISP and use "fold -sw" to re-format it to 132-columns (which I always prefered).
(or use the MS-DOS or Linux GNU utilities)

You'd think it'd be written in 40-columns.But I always just wrote in "infinite" columns since Atari doesn't lack line-wrap like many IBM text viewers.I had a Atari ML programme that would re-format it to whatever I wanted.

I mean you can make it any other bizarre ways you want,but leave us a text version so we can read the blasted thing!

But I remember that what got ICD working on SpartaDOS 3.2 was that BASIC XE
wouldn't work with SpartaDOS 2.3 because it needed some OS "shadow" RAM.
i.e.RAM "under" the OS,not RAM shadowed from/to hardware registers.
Sorry if that's confusing,but we always called it "shadow RAM".As opossed to
shadow registers like 709-712 that you use to change colours.

Yeh,let's go over to the Windows newsgroups and make fun of how INCREDIBLY slow a Windows NT 48MB machine running Microsoft Internet Explorer is!
(it's like my Linux machine when I only had 5MB,X and Netscape!)
I have to use those damned things at the library.It's always thrashing the hard disk drive whenever it needs to download a animation or use some other external programme.And aparently it up to the programme to keep it's window/screen updated.Sometimes I move a window and it leaves a white rectangle behind.
(that was optional on the Amiga.Intuition could also keep track of a window's contents)

Several things to keep in mind with disk images, density, and DOSs:

1. If you're using 256-byte (double density) ATR files, there seems to be some confusion as to whether the first 3 sectors are stored as 128 bytes or 256 bytes. I'm quite certain that an image I created with an old version of SIO2PC only stored 128 bytes for the first 3 sectors, though I've seen other programs that compute the offsets within the file based on the first 3 sectors being 256-byte sectors. I therefore suggest avoiding double-density disk images, unless you're willing to deal with the potential hassle.

2. MyDos uses true 2-byte sector numbers at the end of each sector instead of recording the file number, which allows for more than 64 files per disk (using subdirectories), but may make it incompatible with DOS2.x. I'm not sure if this is true when using a 1040 or 720-sector disk, though it certainly is for larger images.

3. A number of games save the high scores by writing directly to some sector that wasn't used in the original distribution. While often this was sector 720, it wasn't always (I remember hacking Wizard of Wor to change it to 720 at some point). I would definitely recommend leaving that sector free. In fact, I would consider for very large images leaving all of the first 720 sectors free! (This may require creating a large blank file and then deleting it when you're done.) I assume that this is the reason that several of the famous mega-images contain corrupted files.

BTW, does anyone know the byte code that I would see in a file that uses the OS to do sector I/O? I think it was a "JSR ($E453)" or something like that. I could probably modify my binload program to spit out a warning if a file contained that sequence. (My binload program analyzes binary load programs off-line under DOS or Unix, and cleans them up a bit in some cases.)

RAMdisk only significant advantage?? DOS 3 was my first Atari dos and
even as a newbie I was amazed at how easily I could fill a disk up.
DOS 3 had a MONSTER cluster size for an 8-bit computer. I think it
had something like 1K as a minimum allocation unit. Many 8-bit files
are smaller than that so let us say 250 bytes of text would take up a
1K spot on the disk. I had 10 disks or so of various files that
shrunk down to 6 disks when I got 2.5. DOS 3 sucks!!!!!

I wouldn't recommend using a phoney address, it makes it nearly
impossible for someone to reply to you via E-Mail. Instead, just set up
your filters to take any message which does not contain your address,
and dump it into the trash folder. This will eliminate 99%+ of all the
junk E-Mail.

The Shadow

I have seen (have, actually) both the black and the tan/beige XL
supplies. Both have cooling slots. The beige supplies have dual
regulators in them and put out more power than the others.
I would guess that your old power supplies just died a natural death...
the regulators are pretty much self-limiting and thermally protected.
You push them too hard and they just shut down.

<sound of screaming man gone hopelessly insane>

God this game is SO BAD, a disk flipping hypnotic nightmare FROM HELL!
It's weird! I mean what is the object? Usually my character dies off
before he can buy a weapon. Other times I strategically survive for a
few rounds and make it to a guild where the dark masters, get this,
INCREASE MY ATTRIBUTE BY 1!!!

Yay. Excuse me if I'm not overcome with elation, but repeated bouts of
mindless staring at the tv screen while the game rebooted have really
made me a negative person.

No. Actually, the 8086 was introduced before the 8088. The 8088 was
produced by Intel as a way of "shoe-horning" an 16-bit 8086 into
existing 8-bit architectures. 8-bit archatecture components and
chipsets were already available relatively cheap so the 8088 was made
to take adavantage of that savings.

I also had some great deals lately sunday at the local flee market I bought a
800xl and a 1010 tape deck both in box (and manuals)for $5.00 the man said
make an offer and jokingly I said five bucks and to my suprise he said OK. At
another booth I saw an XE game system in box the guy claimed it work and he
wanted $25.00, I talked him down to $15.00. I got it home it all looked new
when I pluged it in it started the memory check and had strange charactor all
over the screen. I then hooked up the power supply from my 130xe and now it
works like a charm (the carts that came with it and the light gun, I
converted my joyskick extension cord to work with the XEGS keyboard and can
now type in programs on my lap)

P.S. the 800xl and 1010 tape deck also works great

PS again I also two weeks ago bought at Walden Software(a electronics boutiqe
store) two games for the Jaguar NEW NBA JAM for .99(can you beleave it a buck)
and brutal sports football for 2.99 also new. So it you own a Jaguar find
your local Walden Software and ask them about there JAG games(Then kept them
in the back room so not to take shelf space).

Source record: 66260

It's been a long time, but let's try :
SD = 720 (709 usuable ?) sectors
ED = 1040 (999+ it says on the dir command)
DD = 720, but it's holding twice as much in each sector

DOS XE, MyDos, Spartados, Superdos, Topdos, Bibodos and probably a lot
more, but DOS 1.0, DOS 2.0 (there's a patched version out there that will),
DOS 2.5 won't format DD. Correct me if I am wrong! Take Atarian care

I would assume that at the very least, M$ Basic might be useful if you
want to use string arrays. Then again, I suppose there's probably
other alternative Basics for the Ataris that have this as well...

Hi,

while improving Atari800 emulator I encountered the following problem: I
need to know _exactly_ when Antic steals cycles from CPU, when the RAM is
refreshed etc. I repeat - I need to know exact cycles, in every ANTIC mode..
Without this information the emulator will never be accurate.

Perhaps you've got an old book about Atari800/XL/XE internals where the
timming is described?

Petr

The string commands were nice. It was most useful, though, for
running generic MS Basic programs published in books and magazines
without having to make major modifications to them.

I would not recommend bothering with it today, except to fill out your
collection.

The first, disk-only version had a *bizarre* memory overlay scheme to
prevent easy disabling of the copy-protection, which was just the old
bad-sector scheme. The result was that it took many times as long to
load the scrambled segments into memory (they overlapped and probably
had some decoding scheme buried in there too) than should have been
necessary to load 10-16k program (I forget its actual size).

I've found a good way to deal with junk is to just delete it.

Replying with a "remove" header is used to get your email address.

I used to get a mild torrent of junk, it's pretty much a trickle now, I simply delete anything that begins with, "Dear friend".

> any other DOS 3 users out there?

Mark, If you are still using DOS 3, please consider changing to
something more compatible, like MyDOS, AtariDOS XE or (my favorite)
SpartaDOS. DOS 3 is completely incompatible with everything. MyDOS is
available on many web and FTP sites and is probably the most compatible
to other Atari DOSes than any other. SpartaDOS is a bit more powerful and
mostly generally compatible and is available in disk version at some FTP
sites for free. SpartaDOS X cart may be available through vendors like
B&C Computervisions www.myatari.com or American Technivision.
I highly recommend getting rid of AtariDOS 3 as your main DOS. You'll
be much better off for it.

If you have received some junk e-mail, then they ALREADY have your
e-mail address. I agree though, that you should never reply with
remove... that merely confirms to them that you are there and the
address is still valid.

> I used to get a mild torrent of junk, it's pretty much a trickle now, I

A better way to receive virtually no junkmail, is to alter your e-mail
address before you post to any usenet newsgroup. Since I started doing
that, my junk e-mail is nearly eliminated. Usenet would appear to be
far and away the main place that spammers get e-mail addresses.

That brings back the memories. DOS 3 was my first DOS, I used it for quite a while before switching to DOS 2.5 (which I hated to begin with) and now MyDOS. DOS 3 has been much maligned, but it did have some nice features, such as on-board help. I still have my orginal DOS 3 master disk and a few disks formated with it. These days most people tend to use DOS 2.5/MyDOS/SpartaDOS, and for any serious stuff you should really switch to one of those.

If you're interested in using DOS 3 for sentimental or other reasons, and have a 256K (or greater) XL/XE, then you might like to take a look at my ramdisk program, which works with DOS 3 (and DOS 2.0, DOS 2.5, MyDOS and others). That way you can copy the DOS 3 files onto the ramdisk and load them from there, so you can switch between the (for example) format and main menus in a flash. It really makes DOS 3 a whole lot nicer to use, no more having to switch disks (on a 1 drive system) and wait for the menu to load/re-load. The ramdisk will still work with less than a 256K machine, and even with a stock 64K XL/XE (using the RAM under BASIC as a small ramdisk), but you will have to figure out how the DOS 3 disk layout is managed so that the disk size as seen by DOS 3 is the same as the ramdisk size, otherwise you will run into problems. It shouldn't be too difficult to do, but unfortunately I don't know enough about the DOS 3 disk layout to do it, and don't have the time to figure it out for myself. If anyone does have this info, then I'd be interested in having it. Anyway if you're interested, the ramdisk is available from my webpage (http://www.co.umist.ac.uk/~rje/8bit/atari.html) or from the umich archive and mirrors as ramdrv10.arc under the OS directory.

I've had trouble using those higher density disks too. I think it might have something to do with the usable surface being smaller, since my problems seem to happen at either the first or last sectors (I don't remember which..). The old double densities seem to be the way to go. If B&C is still open, I'm pretty sure they have them.

Source record: 66277

The manual that comes with MSBasic has some examples in the back that made the cartridge kind of fun to play with. I thought some of the most interesting commands available in MSBasic were the player-missle and memory moving routines. The WAIT command would allow video sync timing similar to a VBI and smooth PM animation without any machine language subroutines. I don't remember anything like the WAIT available in the other BASICs.
Anyway, it was one more fun thing to program once or twice, but, of course, nothing near as satisfying as the results from Action! or a macro assembly language like Mac65 or the Atari Macro Assembler, or even a program in any BASIC with a few assembly language subroutines.

(Somebody asks about 5 1/4" disks and somebody else talks about
putting a 'messer upper' in their e-mail address to thwart
spammers.)
Well, I can't easily reply to the 5 1/4" question because I
can't edit the 'from:' address easily. So, that's the downside
to using a bogus 'from:' address.
The thing with 5 1/4". The person said DS/ED. I don't know
what ED is, but I suspect it is HD, High Density and the
person is correct, these High Dens disks are useless in
an A8 drive. The DD (dbl dens) disks, have a hub ring,
the HD disks don't. Don't purchase 5 1/4" disks unless
they have the hub ring. Again HD disks won't work. Wrong
TPI. The HD disks are a 'weaker' magnetic medium because
the HD write signal is higher strength. What happens when
you write to a HD disk in a DD drive is the signal is
too weak to make a reliable magnetic record on the
HD disks. The reverse is writing to a DD disk with
a HD drive, not set for DD, the signal is too strong
and the magnetic areas of the DD disk 'bleed' to
cause 'overlapping' areas of magnetic record.

Hi. Excuse me, but if you are replying to an email that they already sent you, isn't it safe to assume that they already have your email address in there list?

Are you suggesting that they mail to RANDOMLY GENERATED email addresses and hope people reply to that so they can see which ones are actually real?

On the other hand... if your reply to them is confermation of something, what exactly is it conferming? I mean, if you send an email to an invalid address it produces a bounce notification.

Just wondering. I have been replying with the remove as per instructions, and to date have not gotten more junk mail from the same sources at least that I could tell.

>diskettes?

Sorry I cant tell you where to find them but I can tell you what you
need. You can use the IBM style 360KB disks. The 1.2MB disks are
actually not able to be used at the lower capacity formats due to
differences in the magnetic coating material and the expected write
currents of a drive that uses them. Sounds like you need to get an
APE or somehow hook up a 3.5 drive to your Atari8 if you can't get the
right disks anymore. As a last resort, check Radio Shack to see if
they have any of what you need left.

Sorry for the antipam header. I've gotten enough 'Make Money Fast' and 'See Live Sex Shows' emails daily that I had enough and put an antispammer in.

Thanks for the info. Its interesting that when I tried to format the disk and pulled it out the hub was 'wrinkled'. I know now why.

Under SD 720 free sectors, (minus the dos over head)

Under ED 1040 free sectors (minus the dos over head)

Under DD well 720 again but the sectors are 256 bytes instead of 128 bytes

If you have a Xf551 or another drive capable of TRUE DS/DS, you get 1440
sectors.

MyDos, SPartaDos, Dos Xe all support double density (i.e., the Indus
drive) there are also other more obscure dos', like top dos, etc

Dos 3.0, (along with DOS XE, Dos 4.0, and other oddities) are simply
around for historical purposes and complete the collection of Atarians....

But, it would be very interesting to see anyone using any of these dos
formats...

AR: The City and The Dungeon are for patient players.. remember those
games were revolutionary in 1984-1985... At least with the Dungeon you
could run the game off of up to 4 floppies and use the ramdisk,
Which REALLY sped the game up.. I agree, the game takes a long time to
load, but it is very playable.. an RPG is not designed to be won in a day.
Most RPGs takes weeks, months, maybe even years to complete. Save your
character often, and you can build it up.. access AR web sites for hints
and cheats on the game. AR is one of the BEST games ever released for the
8bit when you consider, the sound/music and grafx and also, it is the best
RPG for the 8bit.. Phantasie is comparable, (maybe a little more playable)
but Phantasie has pretty dinky sound and grafx for a newer game...
